Due to the timing of the growth and control factor development under this project, some adjustments may need to be made in the future to the factors developed under this project. As the CENRAP 2002 emission inventory continues to be revised, as well as the base year inventories for the other RPOs, issues may arise related to matching the growth and control factors to a revised base year inventory. In cases where SCCs are changed, added to, or deleted from the base year inventory, the growth and control factors may no longer match correctly to the base year inventory. In these cases, the projection year inventories will be incorrect.

CHAPTER I. INTRODUCTION

The purpose of this project is to prepare emission growth and control factors that can be applied to the Central Regional Air Planning Association (CENRAP) 2002 base year emission inventory to obtain a 2018 emissions inventory for the CENRAP region. The CENRAP region includes the States and Tribal areas of Arkansas, Iowa, Kansas, Louisiana, Minnesota, Missouri, Nebraska, Oklahoma, and Texas. In addition to the CENRAP States, additional factors will be compiled under this project to include the entire CENRAP modeling domain. This will include projected emissions data or projection year growth and control factor data from the other Regional Planning Organizations (RPOs), Canada, and Mexico. All data products will be prepared in SMOKE-compatible format.

These projection year growth and control factor data will be used to support air quality modeling and State Implementation Plan (SIP) development and implementation activities for the regional haze rule and fine particulate matter (PM) and ozone National Ambient Air Quality Standards (NAAQS). The data will be applicable to all source categories and pollutants included in the CENRAP 2002 emission inventory. This includes the following pollutants: sulfur oxides (SO_x), oxides of nitrogen (NO_x), volatile organic compounds (VOC), carbon monoxide (CO), ammonia (NH_3), and particles with an aerodynamic diameter less than or equal to a nominal 10 and 2.5 micrometers (i.e., primary PM_{10} and $PM_{2.5}$).

This Methods Document explains the data sources that E.H. Pechan & Associates, Inc. (Pechan) plans to use and the procedures Pechan will follow in developing the necessary growth and control data for this project. Chapter II of this document presents Pechan's planned methods for developing control factors and growth factors for the CENRAP States. The methods are presented separately for each of the major source categories. Chapter III of this document presents the data sources and methods that Pechan will use for developing the data for areas outside of the CENRAP States, including other RPOs and Canada and Mexico. References are included in Chapter IV.

[This page intentionally left blank.]

CHAPTER II. METHODS FOR THE CENRAP REGION

A. CONTROL FACTOR DEVELOPMENT METHODS AND DATA SOURCES

1. Non-EGU Point Sources

a. Federal Controls

For non-electricity generating unit (EGU) point sources, the analysis of Federal controls will focus on maximum achievable control technology (MACT) standards. Numerous MACT emission standards have been promulgated since 1990, and are designed to control emissions of hazardous air pollutants (HAPs) from stationary sources. Many of the MACT standards are expected to produce associated VOC emission reductions, so the 2018 control factors need to capture the expected effects of post-2002 MACT standards.

Pechan prepared criteria pollutant-specific emission control factors for various projection years (including 2018) for the Lake Michigan Air Directors Consortium (LADCO) during late 2004. The procedure for developing the MACT standard-associated control factors included identifying source categories and associated Source Classification Codes (SCCs) for each MACT standard having a post-2002 compliance date for existing sources. The control factors for most MACT categories are based on information found in the preamble to the final rule of each MACT subpart as published in the *Federal Register*. Pechan plans to circulate this table of control factors to the CENRAP States for review before using this table to develop non-EGU point source control factors for the CENRAP States.

b. State/Local Controls

CENRAP States will be surveyed to gather information on control programs for the 2018 inventory. The general approach is to use State contacts and information for 1-hour ozone and PM_{10} SIPs to determine where post-2002 emission reductions are expected. Two States where we expect there to be post-2002 non-EGU point source emission reductions include Texas and Missouri. For Texas, it is expected that control factors will be based on the control factor file developed by Pechan during 2001 for the prior Western Regional Air Partnership (WRAP) emission forecast to 2018, with updates to a 2002 base year and to reflect recent SIP updates (Houston-Galveston area). Another possible way to approach this is to obtain the most recent Texas control factor file from the Texas Commission on Environmental Quality (CEQ) and incorporate it into the CENRAP State control factor database. Key issues in determining whether using any new Texas CEQ control factor files in this analysis is advisable include whether this file is for a 2002 base year inventory, and how the reductions in highly reactive VOCs that are required in the Houston-Galveston area SIP are treated in 2002 and any forecast years.

The portion of eastern Missouri that is within the fine grid is affected by the NO_x SIP Call, so controls would be expected to be added in those counties to reduce point source NO_x emissions

between 2002 and 2018. It appears to us that the associated Missouri rule affects NO_x emissions from EGUs but not some of the non-EGU source categories like industrial boilers/turbines, stationary internal combustion engines, and cement kilns that are regulated in other NO_x SIP Call affected States. Rules that potentially affect the non-EGU source categories appear to be under development. Pechan plans to inquire with the Missouri Department of Natural Resources to determine whether control factors for these non-EGU categories should be included in the 2018 control factor file. The number of affected sources appears to be small enough that source-specific control factors can be developed.

We can also survey the other CENRAP States (besides Texas and Missouri) to determine whether these are State/local regulations that would be expected to provide post-2002 emissions reductions. If there are, pollutant-specific control factors will be developed for those geographic areas by SCC.

2. Area Sources

For the CENRAP States, Pechan will contact each State to obtain information for any on-the-books controls affecting non-EGU point and area sources from 2002 to 2018. Pechan will also compile information for national controls affecting these sources from EPA regulatory support documents. Based on the analyses performed by Pechan for other RPOs, the Federal controls for which area source control factors are expected to be developed is limited to residential wood combustion. For this analysis, a 20-year estimated lifetime for woodstoves and fireplace inserts will be used along with the SCC-specific growth factors, and emission factor ratios by SCC, to account for the replacement of retired woodstoves that emit at pre-new source performance standard levels, with new wood burning equipment, that would be catalyst-equipped. Emission factor ratios will be pollutant-specific.

Federal rules affecting VOC solvent emissions such as those from consumer products and architectural and industrial maintenance coatings are expected to be incorporated in the 2002 emission databases, so no post-2002 emission rate reductions are expected for these categories.

3. EGU Point Sources

Data sources to be used for developing EGU control factors include CENRAP's 2002 nine State point source National Emissions Inventory (NEI) input format (NIF) data files (prepared by Pechan and Carolina Environmental Program and delivered on December 10, 2004), the Workgroup-selected growth factors, and the U.S. Environmental Protection Agency's (EPA's) 2020 Integrated Planning Model (IPM) Base and Clean Air Interstate Rule (CAIR) Control post-processed scenario data files (developed by Pechan for EPA from IPM parsed output files). Because 2018 IPM data from two RPOs are unavailable, 2020 data will be used as a surrogate (with CENRAP's agreement). This should pose no significant problem since no known pollutant regulations are in effect in 2020 and not 2018. The 2020 Base and Control (CAIR) post-processed IPM scenario data files include annual emission values for seven pollutants – sulfur dioxide (SO_2), NO_x, CO, VOC, NH_3, primary PM_{10}, and primary $PM_{2.5}$ – as well as annual heat input; only SO_2, NO_x, and heat input are provided in the initial IPM files; the other emissions, along with throughput, were developed during the post-processing phase. Because EPA required

that Pechan use an older emission factor file from 2003, and new NH_3 emissions factors for EGUs were developed in Spring 2004, the post-processed files delivered to EPA included ammonia emissions developed using the old emission factors; as agreed to in a January 10th conference call, Pechan will recalculate these emissions using the new NH_3 emissions factors.

For EGUs in the CENRAP States and in the 2020 IPM Base Case and CAIR post-processed data files, Pechan will provide growth and control factors in SMOKE format. The control factors will be provided in SMOKE CONTROL (Table 8.66 in the SMOKE v2.1 User's Manual) formatted files.

Each EGU record in both the 2020 Base and Control Cases will be ORISPL-BLRID matched into the EGU extract of the CENRAP NIF files (if at all possible) to obtain the FIPS State and county, plant ID, and point ID (where a point is generally equivalent to a boiler) as needed. Since the IPM scenarios only have one SCC per boiler, the emissions for all SCCs at a given point in CENRAP will be assigned to the SCC with the largest emissions.

The control factor (cf) for each 2020 Base and Control Case EGU unit will be calculated as follows for each of the seven pollutant emissions:

2020 EGU pollutant's emissions cf = (2020 pollutant's emissions) / (2002 EGU's State-SCC gf ∗ 2002 CENRAP pollutant's emissions summed to the point-level and assigned to the SCC with the largest emissions).

The IPM units that operate in 2020 but either are not in the 2002 CENRAP data (i.e., generic or committed/planned units) or could not be matched, will not be included in the SMOKE CONTROL formatted files because no control factors can be calculated. Yet, they have emissions that need to be accounted for. Based on a conversation with EPA's Marc Houyoux, a principal developer of SMOKE, it would be best for Pechan to provide the projected emissions for those units in either an Excel file or a SMOKE IDA (Table 8.45 in the SMOKE v2.1 User's Manual) point source formatted file.

4. Nonroad Sources

Pechan will contact CENRAP States to determine whether each State has specific nonroad equipment regulations beyond the Federal engine standards that are expected to be in place by 2018. In cases where State regulations do exist, Pechan will determine the affected SCCs and pollutants, and will compile or develop estimates of the percent emission reduction of the rule in 2018. To date, Pechan has determined that the States of Iowa, Kansas, Minnesota, Nebraska, and Oklahoma do not have additional air requirements for nonroad sources.

Pechan has compiled estimates of control effectiveness for 2018 for Federal regulations affecting diesel locomotives and commercial marine engines. This information is available from the relevant Regulatory Support Documents prepared by EPA (EPA, 1998; EPA, 1999; EPA, 2003). These regulations include engine exhaust standards, as well as diesel fuel sulfur limits that will reduce SO_2 and PM emissions. For their 2003 aircraft engine NO_x emission standards, EPA did not prepare emission reduction estimates because any such reductions were believed to be

modest (e.g., 94 percent of aircraft engines are currently meeting or exceeding these standards). Therefore, Pechan does not propose to account for aircraft emission reductions from these standards for this analysis.

In running the NONROAD2004 model, all Federal engine standards are accounted for, with the exception of evaporative emission standards for large spark-ignition and land-based recreational gasoline equipment. The evaporative standards for recreational equipment only affect permeation emissions, which are not currently included in NONROAD2004. As such, baseline emissions and reductions will not be modeled. The large spark ignition standards affect a subset of evaporative emissions for engines of a specified horsepower (EPA, 2002). Under contract to LADCO, Pechan has developed estimates of SCC-specific emission reductions for this standard, which can be applied to the NONROAD model output as a post-processing step.

5. Onroad Sources

For the onroad sources, control measures are defined in terms of inputs to the SMOKE MOBILE6 files rather than a control factors file. These input files will incorporate all promulgated Federal control programs, including the heavy-duty diesel (2007) engine standard and low sulfur diesel fuel as well as the Tier 2 emission standards and low sulfur gasoline program. Federal control programs are generally modeled through the MOBILE6 defaults, with no specific user input commands necessary. Reformulated gasoline will be modeled in the following nonattainment areas: St. Louis (4 Missouri counties plus St. Louis City), Dallas-Fort Worth (4 counties), and Houston-Galveston (8 counties).

Pechan will contact each of the CENRAP State contacts to determine whether any changes in fuel programs or inspection and maintenance (I/M) programs, from those modeled in the CENRAP 2002 emission inventory, are expected to take place by 2018. Pechan will also determine from these contacts whether any other area-specific control programs are planned. If any programs are planned that cannot be modeled with MOBILE6 (e.g., transportation control measures), Pechan either will develop control factors that can be applied by the emission modelers to the resulting onroad emissions or will adjust the vehicle miles traveled (VMT) growth factors to account for the control measure, depending upon which approach is appropriate for the specific measure.

B. GROWTH FACTOR DEVELOPMENT METHODS AND DATA SOURCES

1. Non-EGU Point Sources and Area Sources (EGAS)

Pechan will develop emission activity growth data for the CENRAP States using a combination of approaches/data sources. For the most part, Pechan will rely on growth factors that are produced by EPA's Economic Growth Analysis System (EGAS). Under Task 5, Pechan prepared a Technical Memorandum comparing EGAS Versions 4.0 and 5.0 (Pechan, 2005).

In preparing the Task 5 memorandum, Pechan reviewed the indicators selected as default emission activity growth surrogates in EGAS 4.0 and 5.0 for the highest-emitting point and

nonpoint SCCs in the CENRAP base year inventory. Pechan then reviewed alternative data sources for the availability of better growth surrogates. Based on this review, Pechan identified alternative growth indicator recommendations for a number of important CENRAP source categories (e.g., use of *Annual Energy Outlook* projections for oil and gas production SCCs). In addition, Pechan identified alternatives to the State-level population projections from EGAS (i.e., county-level population projections prepared by government agencies/universities in each CENRAP State).

Chapter III of the Task 5 memorandum details Pechan's recommendations for the methods and data sources to use in developing stationary point and nonpoint (area) source growth factors for the CENRAP States. Pechan will prepare emission activity growth data for the stationary source emission sources in the CENRAP States that reflects CENRAP feedback on the recommended methods and data sources that are outlined in this chapter.

2. EGU Point Sources

a. Data Sources/Quality Assurance Issues

Data sources to be used to calculate EGU growth factors include EPA’s 2020 IPM Base post-processed scenario data file (developed by Pechan for EPA from IPM parsed output files), EPA’s 2002 EGU inventory, and EGAS 5 EGU 2020 growth factors. Reasons for these choices are explained below.

Pechan will compare the CENRAP nine State-SCC level (2002 to 2020) EGAS 5 growth factors with growth factors calculated as throughput (fuel consumption) ratios derived from EPA’s 2020 Base Case Scenario and the 2002 EGU inventory developed for EPA (and based on the Department of Energy’s Energy Information Administration (EIA) Form EIA-767 and EPA’s Clean Air Markets Division (CAMD)’s Emission Tracking System/ Continuous Emissions Monitoring (ETS/CEM) reported data).

For the IPM-based growth factor development, Pechan originally planned to use the EGUs extracted from the CENRAP data files for the 2002 throughput, but found that several States did not report throughput. We tried to fill in missing values by back calculating throughput using CENRAP reported CO emissions (which would be uncontrolled, unlike SO_2 and NO_x; and larger in magnitude than VOC) and its emissions factor (or the SCC-based EPA-approved uncontrolled emission factor for CO if no emission factor was included in the CENRAP files). However, from a check of some CENRAP records with both throughput and CO reported, it was found that the back-calculated throughput was frequently different from the reported throughput (i.e., had a greater than ten percent difference).

An additional issue with using the CENRAP data files is that we first broadly defined EGUs as those records with a positive ORISPL or SIC=4911, 4932, or 4939, and SCCs beginning with 101 or 201. However, we found several plants “missing” from the CENRAP EGU data that were in either the EIA-767 or ETS/CEM data files; these plants may be in the CENRAP data files, but not in our EGU extract. Also, some sets of records with ORISPLs and SCCs beginning with 101 or 201 did not have any boiler IDs included in the data files and/or some had some

boiler IDs identified and some not (and some seemingly duplicated). Additionally, we found some discrepant ORISPLs.

Pechan also compared total SO_2, NO_x, and CO emissions for each of the nine CENRAP States from the 2002 Inventory and the all inclusive CENRAP EGU extract. In most cases, the 2002 EGU inventory emission totals were greater. All three pollutant emissions are within a 10 percent difference for three States (Kansas, Missouri, and Nebraska); NO_x is within a 10 percent difference for five more States (Iowa, Louisiana, Minnesota, Oklahoma, and Texas); and SO_2 is within an 11 percent difference for three more States (Minnesota, Oklahoma, and Texas); Arkansas' emissions for all three pollutants were not close, perhaps because some plant data in the CENRAP files were missing, some emissions may be reversed, etc.

Pechan had not anticipated nor allotted hours for performing quality assurance (QA) on the CENRAP data, but found it necessary to do so to some extent to determine whether the data could be used for throughput. To avoid further expenditure of hours, we determined that it would be best to use the 2002 EPA EGU Inventory for the 2002 throughput data, rather than the CENRAP data files. Please note that we are not stating that all nine of the CENRAP States have all or any of the issues addressed above, but that enough of them did that we were not able to either use the reported throughput or calculated throughput at the State-SCC level with a high degree of confidence.

b. Growth Factor Calculation

The growth factor (gf) for each State-SCC will be calculated as follows:

gf = (2020 IPM Base Case throughput aggregate) / (2002 EGU inventory throughput aggregate),

where:

the 2020 IPM Base Case throughput is derived from the given heat input and a default fuel heat content; and

the 2002 EGU inventory throughput is reported data if the boiler is included in the EIA-767, and is derived from the given heat input and a default fuel heat content if it is not in the EIA-767 but is in the ETS/CEM data file.

Pechan will provide an Excel data file which will include the nine State-SCC level records and their EGAS 5 and IPM-based growth factors for 2020 as well as a Technical Memorandum that includes a recommendation and rationale for the proposed growth factor methodology.

A summary report of the changes in 2018 IPM inputs requested by the Visibility Improvement – State and Tribal Association of the Southeast (VISTAS) and the Midwest Regional Planning Organization (MRPO) was provided to Pechan, along with a response to a follow-up question. If VISTAS and MRPO approve the release of this information, with CENRAP's agreement, it will be included in the final report and will serve as the part of the deliverable Technical Memorandum that presents a summary of the changes made to IPM inputs by the other RPOs.

The growth factors (whose methodology will be determined by the CENRAP Workgroup) from Task 6 will be provided in SMOKE PROJECTION format (Table 8.70 in the SMOKE v2.1 User's Manual).

3. Nonroad Sources

For the aircraft, commercial marine vessel and locomotive categories, Pechan will develop emission activity growth data for the CENRAP States using EGAS. Pechan's recommendations for developing growth factors for these categories were outlined in a Task 5 Technical Memorandum, and the final methods will reflect any additional feedback from CENRAP.

Also as part of Task 5, Pechan will prepare a separate Technical Memorandum to describe the proposed adjustments to the NONROAD model national growth rates to reflect State data for significant categories. The data to regionalize the NONROAD model growth factors will be obtained from REMI, as incorporated into EGAS (Houyoux, 2004).

4. VMT for Onroad Sources

To estimate growth in onroad VMT, Pechan will first ask CENRAP for appropriate contacts from their State Departments of Transportation and from the major metropolitan planning organizations (MPOs) in their State. Pechan will then inquire of these contacts whether they have developed their own growth projections, and if so, will request any available documentation on the development of these growth factors and the growth factors themselves. The documentation will be important in understanding the geographic area covered by the growth factors, the base and projection years of the growth factors, and the sources of data driving the projections. The documentation should also provide information on the level of detail at which the growth factors were developed (e.g., do the factors vary by interstates vs. arterials, by rural area vs. urban area, by vehicle type, etc.). Any growth factor data will need to be provided electronically in database (Access, DBF, or MySQL), spreadsheet (Excel), or text file format for processing under this project. When VMT growth factors are provided for a different base and projection year, Pechan will consult with the agency supplying the data to determine the best method for converting the growth factors to a 2002 to 2018 projection. For areas with no local VMT growth factor information available, or those for which growth factors cannot be appropriately calculated within the time and resources available under this contract, Pechan will use EGAS VMT growth factors.

[This page intentionally left blank.]

CHAPTER III. METHODS FOR AREAS OUTSIDE OF THE CENRAP REGION

A. CANADIAN EMISSION ESTIMATES

Pechan expects to provide emission estimates for Canada to CENRAP using data and methods that are consistent with those being used by LADCO/MRPO and EPA to estimate current and future year emissions for these provinces. These data sets are currently limited to historical emission years (1995 and 2000). It is our understanding that LADCO is using/planning to use 1995 point source emission estimates and 2000 onroad/off-road/area source emission estimates to estimate Canadian emissions for their modeling domain. (The 2000 point source emissions data is not being used because of confidentiality limitations.) The 2000 Canadian emission data sets for the three sectors (non-point/area, nonroad mobile, and onroad mobile) are available at: http://www.epa.gov/ttn/chief/net/canada.html#data. This file contains information in both dBaseIV and SMOKE IDA format.

While we know that Environment Canada compiles emission projections on a regular basis to support the development of Federal and provincial emission control strategies, it is not clear whether Environment Canada would be able to provide growth and control factors on a timely basis for this CENRAP project. Pechan will contact Marc Deslauriers of Environment Canada on this issue. In short, though, Pechan expects that its recommendation will be that CENRAP use the base year Canadian emissions data without adjustments for all future year model simulations. If we want to pursue the course of developing our own growth and control factors to apply to Canadian base year emissions to estimate 2018 emissions, some information on the forecasting methods that Environment Canada uses is available from a draft NARSTO report. However, the description in the NARSTO report is less detailed than is needed to develop source category-specific growth and control factors. This alternative is probably best pursued by our contacting Marc Deslauriers to determine that organization's willingness/ability to provide us with either the data or the methods that they have developed to prepare emission forecasts to a year close to 2018.

B. MEXICAN EMISSION ESTIMATES

The baseline emissions inventory base year for Mexico is for 1999. Inventories for the years 2002 and 2012 were also estimated in order to understand how growth and existing control strategies may impact future emissions. Currently, the 1999 emission inventory is available, but the emission databases for the other years are not. Moreover, the point source database will most likely be proprietary, and could require signing a non-disclosure agreement for access. Therefore, the three alternatives for estimating 2018 emissions for Mexico for this CENRAP project appear to be:

1. Use the available 1999 emission databases as is.
2. Pursue obtaining the 2012 Mexican emissions database via Leonora Rojas to see if it might be available on a timely basis.

3. Develop growth and control factors to apply to the 1999 emissions data to better estimate 2018 emissions. We have a summary description of how Mexico performs its own projections to use as a guide for doing this. In general, growth factors are applied to all sectors, but control factors are only applied for onroad vehicles.

C. WRAP EMISSION ESTIMATES

WRAP's current schedule for preparing any new emission projections for its States will not provide any new information by March 2005, so Pechan expects to use the previous WRAP 2018 emission forecasts as the basis for what it provides to CENRAP. The existing WRAP 2018 emission forecasts are made from a 1996 base year. One potential update to the previous non-EGU point and area source forecasts is adapting the previous projections (which were prepared by Pechan) to incorporate updated growth factors, and to use the 2002 emissions data set as the new base year. However, these updates may be difficult to accomplish within the project constraints.

D. VISTAS EMISSION ESTIMATES

Pechan has contacted the VISTAS Technical Coordinator, Pat Brewer, to determine the availability of emission projection data for this project. VISTAS has recently completed 2018 emission projections for its States. These projection data are now being reviewed by the States. VISTAS will need to get permission from the States in order to release the data to CENRAP. It is expected that this would occur during February. SMOKE-ready modeling files for VISTAS are expected to be completed in January. Pechan will have further conversations with VISTAS to determine whether the mass emissions files or SMOKE files are more appropriate for CENRAP's purposes. It may be preferable to obtain the annual mass emission files, as the SMOKE modeling files were set up to model specific episodes that may not be consistent with the modeling that CENRAP will do. If CENRAP determines that it is preferable to use the emissions, Pechan will format the emissions in SMOKE/IDA format.

E. MRPO PROJECTIONS

For these five States, Pechan has developed 2018 (and other year) growth and control factors for LADCO for all man-made emission sectors, except on-road vehicles. Therefore, we expect that these same growth and control factors will be delivered to CENRAP. Because LADCO is performing the emissions processing of these files, Pechan plans to check with Mark Janssen to determine whether LADCO made any revisions to these files during its processing steps. If so, the revised files will be obtained from LADCO. We will also check with LADCO about the status and availability of their on-road vehicle emission files.

INTRODUCTION

The purpose of this project is to prepare emission growth and control factors that can be applied to the Central Regional Air Planning Association (CENRAP) 2002 base year emission inventory to obtain a 2018 emission inventory for the CENRAP region. The CENRAP region includes the States and Tribal areas of Arkansas, Iowa, Kansas, Louisiana, Minnesota, Missouri, Nebraska, Oklahoma, and Texas. In addition to the CENRAP States, additional factors will be compiled under this project to include the entire CENRAP modeling domain. This will include projected emissions data or projection year growth and control factor data from the other Regional Planning Organizations (RPOs), Canada, and Mexico. All data products will be prepared in SMOKE-compatible format.

These projection year growth and control factor data will be used to support air quality modeling and State Implementation Plan (SIP) development and implementation activities for the regional haze rule and fine PM and ozone National Ambient Air Quality Standards (NAAQS). The data will be applicable to all source categories and pollutants included in the CENRAP 2002 emission inventory. This includes the following pollutants: sulfur oxides (SO_x), oxides of nitrogen (NO_x), volatile organic compounds (VOC), carbon monoxide (CO), ammonia (NH_3), and particles with an aerodynamic diameter less than or equal to a nominal 10 and 2.5 micrometers (i.e., primary PM_{10} and $PM_{2.5}$).

This Quality Assurance Project Plan (QAPP) specifies how data quality objectives of accuracy, completeness, and representativeness will be met in compiling the growth and control factor data to be used as inputs to 2018 projection year regional emissions modeling for the CENRAP region for air quality modeling purposes.

A series of checklists will be prepared to implement the quality assurance (QA) steps. The QA checklists will include information on the specific QA item, the date that the QA check was performed, and the person who performed the QA check.

II. QA PLAN FOR CONSOLIDATION OF EMISSIONS INVENTORIES

A. Project Management

Specific project management elements are discussed below.

1. Distribution List

Ms. Kathy Pendleton, CENRAP Project Manager
Ms. Lisa Brenneman, CENRAP Project Manager
Ms. Annette Sharp, CENRAP Technical Director and Quality Assurance Officer
Mr. James H. Wilson, E.H. Pechan & Associates, Inc. (Pechan) Corporate QA/QC Coordinator
Ms. Maureen Mullen, Pechan Project Manager

Mr. Steve Roe, Pechan QA Reviewer

2. Project / Task Organization

Ms. Kathy Pendleton of CENRAP will be the primary technical contact and Project Manager. She will be assisted by Ms. Lisa Brenneman. Ms. Annette Sharp, will be the Technical Director and Quality Assurance Manager (QAM). Ms. Sharp will be involved in all quality assurance/quality control (QA/QC) activities.

Pechan's QA/QC policy requires that all work be documented, defensible, of known and acceptable quality, and consistent with all contract requirements. This policy is implemented through an integrated three-tiered approach that includes corporate, department, and program elements. At the corporate level, Pechan management provides oversight of the QA/QC program and approves and enforces the overall program. To assist in implementing these functions, Pechan maintains a corporate QA/QC unit that monitors the program, prepares guidelines, and conducts independent program audits.

The Pechan Corporate QA/QC Program is implemented through the Corporate QA/QC Plan and corporate guidelines. The Corporate Plan is an internal document that states the corporate policy and the requirements for department and project plans. The plan is supplemented by guidelines that are used to develop or update department plans and standard operating procedures (SOPs). Department management ensures the technical and fiscal quality of work through management oversight of projects assigned to the department and work performed by department staff; establishes and enforces department plans; approves project plans, budgets and schedules; and ensures a thorough technical and department management review of work.

The Pechan Corporate QA/QC Coordinator, Mr. James H. Wilson, is responsible for QA/QC functions throughout the firm, and has the necessary authority and independence to identify, report, and correct any existing quality problems. The Pechan QA reviewer for this project will be Mr. Steve Roe. Mr. Roe will conduct QA review on each of the SMOKE files developed under this project, on the data and methods used to develop growth and control factors in the SMOKE files, and on the final documentation.

Pechan's Project Manager, Ms. Maureen Mullen, will direct all work to be completed for this project. Ms. Mullen will ensure that all support staff are familiar with and understand the data quality objectives, and the procedures to be followed for meeting the objectives, as well as the requirements of the QA plan (e.g., completion of QA/QC forms).

3. Problem Definition / Background

SIPs for regional haze mitigation must contain emission inventories. Related emission inventories are needed for air quality modeling of regional haze. Inventories prepared for the SIP submittal and for use in modeling are prepared in different formats, but both should be derived from the same or comparable input data. Furthermore, regional modeling will encompass States outside the CENRAP region, so inventory methods should be coordinated with

other regions to the extent possible. The eastern RPOs (including CENRAP) have selected 2002 as the baseline year for regional haze modeling. Also, in order to demonstrate progress in improving visibility, it will be necessary to forecast emissions for future years. This project will result in a set of growth and control factors that can be used in SMOKE emissions modeling to project the CENRAP 2002 base year emission inventory to 2018.

4. Project / Task Description

The description of this project by task can be found in Pechan's response (dated November 18, 2004) to the Request for Quotes (RFQ) for "Schedules 3 and 9 - Development of Growth and Control Inputs for 2018 Emissions Modeling" and the "Award of Work and Notice to Proceed" that CENRAP issued to Pechan (Contract Number 04-0628-RPO-018) on December 1, 2004.

5. Data Quality Objectives

The main data quality objectives that Pechan will work to fulfill include:

- Accuracy – Pechan's QA Reviewer will ensure that 100 percent of the procedures/calculations that a Pechan staff member develops and applies to develop growth or control factors will be checked for accuracy and completeness. The procedures/calculations will first be tested on a data sample and the results will be reviewed to ensure that the procedures/calculations are applied as intended and that the results make sense. Adjustments to the procedures/calculations will be made if the results indicate flaws in the initial procedures/calculations. The procedures/calculations will be applied to the entire data set after the procedures/calculations have been tested for accuracy. Sample calculations will be documented covering all procedures.

- Completeness – As part of the quality control (QC) process, review by Pechan, as well as State/local/Tribal (S/L/T) agencies, may indicate missing growth or control factors for certain sources and/or pollutants for a particular county or jurisdiction. Pechan will compare the growth and control factor files to the CENRAP 2002 base year emission inventory to identify source category/county combinations that may be missing growth factors and source category/county/pollutant combinations that should be controlled but that have no control factors in the control factor database.

- Representativeness –Representative growth and control factors will be compiled that can be used by CENRAP to develop a representative 2018 emission inventory. The QA checks on data content discussed in section D of this QAP will be used to identify missing data or data that exceed typical ranges for review with CENRAP and the S/L/T agencies. These factors will be corrected or revised as approved by CENRAP.

- Comparability – The CENRAP 2018 growth and control factors will be compared to those used by the U.S. Environmental Protection Agency (EPA) in its Clean Air Interstate Rule (CAIR) modeling as well as those used by other RPOs for similar projection year emission inventories. Significant differences between these growth and control factor data will be evaluated and any necessary corrections to the data will be made.

6. Documents and Records

Pechan maintains a records management system to ensure that completed work meets EPA documentation requirements. Pechan also maintains a record-keeping plan to identify and file information. The company assigns unique control numbers to all documents and records prepared for and delivered to all clients. These numbers link the materials to the correct contract and work assignment and are used to store the materials in hard copy and electronically in chronological order. The records management coordinator at each Pechan office location assigns the control numbers and maintains these files. Pechan's Contracts Administrator also stores hard copy or electronic versions of all documents and records submitted as contract deliverables as part of the company's contract files.

The Pechan Project Manager will be responsible for the following document and records management activities:

- Determining all deliverables under a project, including work plans, progress reports, and all technical products;
- Determining the time lines for various stages of the document (that is, outline, draft, and final);
- Determining the appropriate review cycle (internal versus external review);
- Determining the appropriate reviewers; and
- Ensuring that all documents and records are incorporated into Pechan's filing system and are distributed to the appropriate recipients.

B. Data Generation and Acquisition

The following explains how data will be acquired or generated for each task of the project:

Task 1. Develop a Quality Assurance Project Plan (QAPP) and Work Plan

This QAPP is being prepared under this task. The following discussion explains the data sources that will be acquired and data that will be generated during preparation of the draft and final deliverables for Tasks 2 through 10. Section D of this QAPP explains the data review and

validation procedures that will be applied during preparation of the draft and final deliverables for Tasks 2 through 10.

Pechan has also prepared a draft work plan for the project. The work plan includes the tasks, budgets, and schedules specified in Pechan's response (dated November 18, 2004) to the RFQ for "Schedules 3 and 9 - Development of Growth and Control Inputs for 2018 Emissions Modeling" and the "Award of Work and Notice to Proceed" that CENRAP issued to Pechan (Contract Number 04-0628-RPO-018) on December 1, 2004.

Task 2. Develop a Methods Document

In the Methods Document, Pechan will explain the data sources to be used and the procedures to be followed for developing the necessary growth and control data for this project. Through this task, Pechan will determine the appropriate contacts and data sources to be used to obtain and develop the growth and control data for the CENRAP States, control data sources for Federal control measures, and vehicle miles traveled (VMT) projection data and sources. Pechan will also determine the available sources for obtaining projection year inventory data for other RPOs, Canada, and Mexico. The methods document will also explain the procedures to be followed when data are not available for a specific source category or geographic area.

Task 3. Identify State Controls

Pechan will query the CENRAP State contacts on State control programs expected to be in place in 2018. In addition, Pechan will use information from 1-hour ozone and PM_{10} SIPs to determine where post-2002 emission reductions are expected. For Texas, Pechan will base the control factors on the control factor file developed by Pechan during 2001 for the prior Western Regional Air Partnership (WRAP) emission forecast to 2018, and update this information to a 2002 base year and to reflect recent SIP updates (Houston-Galveston area). Pechan will account for NO_x emission changes for Missouri counties affected by the NO_x SIP Call. This may include using future year NO_x allowances by unit to estimate unit-specific control factors. Where necessary, Pechan will convert the emission reductions to the control efficiency, rule effectiveness, and rule penetration rates needed for the SMOKE modeling. All rule citations will be fully documented.

For the onroad sources, Pechan will start with the 2002 SMOKE-formatted MOBILE6 files developed for the 2002 CENRAP emission inventory. Pechan will query the State contacts provided by CENRAP for expected changes in emission control programs, such as inspection and maintenance programs, and fuel properties or programs between 2002 and 2018. Local data on fleet information, such as vehicle age distributions, will be kept the same as in 2002. Federal control programs, such as the Tier 2 emission standards, will be accounted for by using the MOBILE6 defaults for such programs.

Task 4. Identify Federal Controls

Pechan will compile information on Federal control measures that will be in place in 2018. Pechan's initial source of information will be the work conducted by Pechan to develop

2018 emission inventory control factors for the Midwest RPO (MRPO). Pechan will review documentation from other RPOs (e.g., VISTAS) and the analysis performed by EPA for the CAIR (this had a 2001 base year), as well as any new information on Federal rules. Pechan will focus its primary efforts for this task on maximum achievable control technology (MACT) standards with post-2002 effects. Where necessary, Pechan will convert the emission reductions from the identified Federal control measures to the control efficiency, rule effectiveness, and rule penetration rates needed for the SMOKE modeling. All rule citations will be fully documented.

Task 5. Compare and Provide a Written Summary of Differences Between the Economic Growth Analysis System (EGAS) 4 and EGAS 5 Models

Pechan will use EPA's EGAS 4 and EGAS 5 data and models to compile 2002 to 2018 State- Standard Industrial Classification (SIC) growth factors for the CENRAP States. These data are available in internal Pechan databases which house the Regional Economic Models, Inc. (REMI) data used in EGAS 4 and EGAS 5. Within each State, the comparisons will be developed at the 3-digit SIC code level with a crosswalk between REMI sectors and SCCs.

For the NONROAD model source categories, Pechan will compile data to develop regional growth factors to reflect relative growth rates in the CENRAP States. These will be used to regionalize the default growth factors in NONROAD that use national historic trends by fuel type to project equipment populations and emissions nationwide.

Task 6. Isolate and Examine Emission Growth Factors for CENRAP Electricity Generating Units (EGUs) using the Integrated Planning Model (IPM) and the EGAS 5 Model

Pechan will obtain the EGU EGAS growth factors from the Task 5 output. Pechan has obtained the IPM 2018 Base Case and IPM 2018 CAIR Case outputs from VISTAS/MRPO. Pechan has also obtained generalized information about the changes made by VISTAS/MRPO to the IPM inputs for this data set. However, MRPO has requested that Pechan not use any of these data until they have been reviewed and approved by the MRPO/VISTAS States. If approval of these files does not come in the timeframe needed for completion of this task, Pechan will use the Base Case and CAIR Case outputs from IPM prepared for EPA during August through November 2004. Pechan has these data in-house for projection years of 2010, 2015, and 2020. Pechan developed the final CENRAP 2002 base year emissions inventory for CENRAP that will be used in this task. Pechan will generate State-SCC growth factors for the EGU sector in the CENRAP States from the heat input or throughput data in the 2002 CENRAP emissions inventory and the IPM outputs.

Task 7. Develop Onroad Growth Factors and Nonroad Emissions Inventory for the Future Case CENRAP Emissions Inventory

To prepare the 2018 NONROAD2004 model inputs, Pechan will first acquire from CENRAP the activity inputs that were used to develop the 2002 base year nonroad emissions inventory. Pechan will adjust the growth rates and fuel program inputs with data obtained or generated under Task 5. These data will then be input to EPA's NONROAD2004 model to

generate a 2018 nonroad emission inventory for the CENRAP States, for all nonroad categories except locomotives, aircraft, and commercial marine vessels. Growth and control factors for these three nonroad categories will be developed under Tasks 3, 4, and 5 with other area sources.

To develop VMT growth rates, Pechan will first develop a list of contacts in the following priority order: (1) major Metropolitan Planning Organizations, (2) State Departments of Transportation, and (3) State air agencies. Pechan will then contact these agencies to obtain available data for projecting VMT from 2002 to 2018. If the data from these agencies are for a different base or projection year, Pechan will inquire as to whether the average annual growth rate over the period projected by that agency can be applied to the period from 2002 to 2018. If it cannot, Pechan will not use that data source (in these instances, data from the next contact based on the above priority will be used). For QA and tracking purposes, Pechan will log the contact information, data file names and date, geographic coverage of data, level of detail of data (e.g., by vehicle type or road type), and base and projection years of data. Pechan will provide this information to the CENRAP QAM before proceeding to incorporate VMT projection data. For counties or States with no VMT projection data available, Pechan will use EGAS VMT growth factors as the defaults.

Task 8. Develop Future Case Inventory of Areas Outside the CENRAP Region

This task will involve gathering and consolidating projection year emissions data or growth and control data for areas outside the CENRAP region. The sources of data include emissions inventories compiled by the other RPOs, the EPA, and the most currently available Mexican and Canadian emissions inventories.

Pechan will generate a list of organizations (e.g., EPA, RPOs, Environment Canada) and contact information for each organization that potentially has data that can be used to develop a 2018 emissions inventory for CENRAP air quality applications. This list will then be provided to the Workgroup for any feedback.

Once the data acquisition contact list has been finalized, Pechan will contact each organization to identify the projection year emissions data or growth and control data available, determine the quality and format of each available data set, and help facilitate the best mode of data transfer of the desired data sets for use in this task.

Modeling inventory databases or growth and control files acquired during this task will be summarized in tabular form so that CENRAP will know the date acquired, the sources used to assemble the data, the contractor(s) and/or organizations that assembled the data, possible deficiencies of the data, time period of the data (e.g., base year and projection year), and other necessary information needed to enable CENRAP to best understand the databases that are available.

Task 9. Prepare Future Case Growth and Control Summary

Pechan will develop the EGU growth factors at the point level of detail based on either IPM or EGAS model outputs, as determined by the Workgroups in Task 6. This will involve

matching the EGU identifiers from the CENRAP 2002 emission inventory to the IPM data. IPM uses unique plant codes (ORISPL) and boiler IDs while the CENRAP inventory uses Federal Information Processing Standard State and county identifiers, plant IDs, and point IDs. From the matched data set, Pechan will develop EGU-specific control factors for all relevant pollutants, based on 2018 IPM emissions data and the 2002 CENRAP EGU data.

For all source sectors covered by this contract, Pechan will develop Excel summary workbooks for each CENRAP State and Tribal area at the SCC level for all relevant source categories and pollutants. The data used in these summaries will be obtained from data generated in Tasks 3 through 7.

Task 10. Prepare a Technical Support Document (TSD)

The Task 2 Methods Document will be used as the starting point for the TSD. Information from the technical memoranda developed under Tasks 5, 6, and 8 and the State and Federal control measure lists from Tasks 3 and 4 will also be included in the TSD. The TSD will document the methods and data sources used in preparing the SMOKE-ready growth and control factors, the nonroad emissions inventory, and the MOBILE6 SMOKE inputs. The Excel workbooks summarizing the growth and control factors for the CENRAP States will be either included in or referenced in the TSD.

C. Assessment and Oversight

Pechan uses assessments to evaluate and improve the quality of environmental data operations. The assessments are an independent process of evaluating the project to ensure that specified requirements of the project are being fulfilled. Pechan will perform periodic audits of data quality and will coordinate with CENRAP's QAM to allow for ongoing oversight of project quality. For this project, QA Summary Reports will be prepared in Excel spreadsheets under Task 9, along with the growth and control factor summaries, to document any QA issues in the growth and control factors. The reports will be sent to each S/L/T agency to review. Each agency will be asked to provide corrections for the QA issues in the spreadsheets, or provide Pechan and CENRAP with directions in supplemental files or by e-mail. Each agency will then return the QA Summary Reports to Pechan. Pechan will then use directions provided in the reports to revise the appropriate growth and control factor files, and will update the reports to log directions that S/L/T agencies provide via e-mail and data provided in supplemental files. A Pechan staff member will then note the date on which revisions are made to the growth and control factor files as specified in the QA reports. Mr. Steve Roe will manage the audit function, which will involve comparing the directions provided in the QA reports to the revised growth and control factor files to ensure that the directions are interpreted correctly, and the files are revised correctly. The auditor will then note in the QA report when corrections have been completed. If corrections are not implemented correctly, the auditor will note this in the QA Summary Report file and will provide follow-up to ensure that the Pechan staff member corrects the issue. Thus, each QA Summary Report file will be used as a chain-of-custody form to document QA issues, S/L/T agency approval for resolution of the issues, and corrections to growth and control factor files.

D. Data Review and Validation

Task 1. Develop a QAPP and Work Plan

Pechan will prepare a draft QAPP and work plan that will undergo review by Pechan internally, and then be submitted to the CENRAP's Workgroups for review and comment. Pechan will revise the QAPP and work plan to address comments provided by the Workgroups. The final QAPP and work plan will be submitted to CENRAP for final approval and signature. The draft and final QAPP and work plan will be submitted in Microsoft Word format.

Task 2. Develop a Methods Document

Pechan will prepare a draft Methods Document that will undergo review by Pechan internally, and then will be submitted to the CENRAP's Workgroups for review and comment. Pechan will revise the Methods Document to address comments provided by CENRAP. The final Methods Document will be submitted to CENRAP for final approval. The draft and final Methods Document will be submitted in Microsoft Word format.

Task 3. Identify State Controls

Pechan will conduct a QA review of the SMOKE control factor files. Range checks will be performed on all values including control efficiency, rule effectiveness, and rule penetration to make sure that all values are valid and reasonable. Comparisons of the control efficiencies will be made with the 2002 CENRAP emissions inventory files to ensure that controls included in the 2002 emission inventory are not double-counted for the projection year. Any point-specific control information will be matched to the 2002 CENRAP emissions inventory to ensure that the correct point identifiers have been used. A QA summary will be developed listing State/SCC combinations in the 2002 CENRAP base year emissions inventory with no control efficiency listed in the State controls file to ensure that all source categories that should have controls applied contain the necessary information in the SMOKE control factor file. Pechan will ensure that the format of the control factor databases are correct based on the SMOKE2.1 User's Guide documentation.

Pechan has developed programs to review MOBILE6 input files. These programs will be modified to perform QA on the SMOKE-formatted MOBILE6 input files to insure that all appropriate control measure commands and input data are included in the appropriate MOBILE6 input files.

Each database in text or database format, as well as each set of MOBILE6 input files, developed during this task will be assigned a version control ID, so that any future modifications of these data sets can be tracked. The version control ID will contain the date that the file was revised, as well as a version number, if more than one revision occurred on the same date (e.g. mobilexxx 2-15-05v2).

Task 4. Identify Federal Controls

Pechan will conduct a QA review of the SMOKE control factor files for the Federal controls as listed above for the State controls. Range checks will be performed on all values including control efficiency, rule effectiveness, and rule penetration to make sure that all values are valid and reasonable. Comparisons of the control efficiencies will be made with the 2002 CENRAP emission inventory files to ensure that controls included in the 2002 emission inventory are not double-counted for the projection year. In addition, checks will be made to verify that source categories with both State and Federal control measures have been given the appropriate controls and that sources are not inappropriately over-controlled. Any point-specific control information will be matched to the 2002 CENRAP emission inventory to ensure that the correct point identifiers have been used. A QA summary will be developed listing State/SCC combinations in the 2002 CENRAP base year emission inventory with no control efficiency listed in either the State controls file or the Federal controls file to ensure that all source categories that should have controls applied contain the necessary information in the SMOKE control factor file. Pechan will ensure that the format of the control factor databases are correct based on documentation in the SMOKE2.1 User's Guide. Each database developed during this task will be assigned a version control ID as described under Task 4, so that any future modifications of these data sets can be tracked.

Task 5. Compare and Provide a Written Summary of Differences Between the Economic Growth Analysis System (EGAS) 4 and EGAS 5 Models

Pechan will conduct a QA review of the SMOKE growth factor files prepared under this task. This will include range checks on all growth factors. Any growth factors above or below the expected range of growth factors will be reviewed for reasonableness. Significant variations in growth factors for the same source categories across States will also be reviewed for reasonableness. The growth factor data will be cross-checked with the CENRAP 2002 emissions inventory to ensure that all State/SCC combinations present in the 2002 inventory have corresponding growth factors (with the exception of onroad and NONROAD model source categories which will be handled in Task 7). Pechan will ensure that the format of the growth factor databases are correct based on the SMOKE2.1 User's Guide. Each database developed during this task will be assigned a version control ID as described under Task 4, so that any future modifications of these data sets can be tracked.

Task 6. Isolate and Examine Emission Growth Factors for CENRAP Electricity Generating Units (EGUs) using the Integrated Planning Model (IPM) and the EGAS 5 Model

The EGAS EGU growth factors to be used in this task will have undergone QA review under Task 5. In developing the IPM EGU growth factors, Pechan will review State/SCC combinations that are present either in the base year or projection year data, but not both. These cases, and Pechan's proposed approach for dealing with these cases for the development of growth factors, will be documented in the Technical Memorandum to be prepared under this task for CENRAP's review. In addition, cases with insufficient data in the CENRAP base year inventory to calculate growth factors will be documented for CENRAP review. The remaining

IPM EGU growth factors by State/SCC will be carefully reviewed. Growth factors that are outside of the expected range of factors will be reviewed for reasonableness and accuracy. If all calculations have been performed correctly, but the data seem unreasonable, these factors will be documented for CENRAP to review and provide corrections or comments on.

Task 7. Develop Onroad Growth Factors and Nonroad Emissions Inventory for the Future Case CENRAP Emissions Inventory

Pechan will use EPA's NIF Format and Content Check QA tool to perform initial QA on the NONROAD2004 NIF output file. Any errors flagged by this tool will be reviewed and corrected as necessary. After the nonroad inventory data are converted into SMOKE format, QA checks will be performed to ensure that the SMOKE-formatted emissions are the same as the emissions in the NIF files. Cross-checks will be performed to ensure that all State/SCC combinations included in the 2002 emission inventory for the source categories included in the NONROAD2004 model are also included in the SMOKE emission files.

Pechan will QA the VMT growth factors prepared in SMOKE format. Range checks will be performed on all VMT growth factors to make sure that all values are valid and reasonable. Any growth factors above or below the expected range of growth factors will be reviewed for reasonableness. Significant variations in growth factors for the same source categories across States will also be reviewed for reasonableness. The growth factor data will be cross-checked with the CENRAP 2002 onroad VMT data to ensure that all onroad State/SCC combinations present in the 2002 inventory have corresponding VMT growth factors. Pechan will ensure that the format of the VMT growth factor databases are correct based on the SMOKE2.1 User's Guide.

Each database developed during this task will be assigned a version control ID as described under Task 4, so that any future modifications of these data sets can be tracked.

Task 8. Develop Future Case Inventory of Areas Outside the CENRAP Region

Each projection year emission inventory or set of growth and control factors for the areas outside the CENRAP region will be assigned a version control ID as described under Task 4 and tracked accordingly. Pechan will ensure the data acquired are formatted correctly for use in SMOKE modeling based on the SMOKE2.1 User's Guide and will document any deficiencies for each inventory database. Pechan will prepare draft summaries for each database indicating the source of the data, base and projection years of the original data, and any data conversions needed from the original base and projection years to the CENRAP base and projection years of 2002 and 2018 for review by CENRAP. Final revisions to the data will be made based on the feedback received.

Task 9. Prepare Future Case Growth and Control Summary

Growth and control factors developed in tasks 3 through 7, as well as the EGU control factors to be developed under this task, will be summarized in Excel spreadsheets by State or Tribal area and SCC. These reports will provide the States and Tribal agencies with an

opportunity to review the growth and control data developed under this project and to provide corrections or comments where the data do not correspond with the agencies' expectations. As discussed in Section C, above, Pechan will also provide QA Summary Reports that show concerns that Pechan or the States might have with some of the growth or control factors that should be given additional review by the agency. These QA Summary Reports will be used to track revisions that need to be made to the draft SMOKE growth and control factor files.

Once the State and Tribal agencies have documented the need for any revisions to the growth and control factors, Pechan will prepare final growth and control factor files in SMOKE format. These files will undergo the same QA checks described in the tasks above, along with the final QA audit ensuring that the requested revisions to the growth and control factors have been appropriately implemented in the final SMOKE-formatted files. Each database revised or developed during this task will be assigned a version control ID as described under Task 4, so that any future modifications of these data sets can be tracked.

Task 10. Prepare a TSD

The TSD will undergo QA review to ensure that all methods and data sources are accurately documented and data are reported correctly. Pechan will revise the TSD to incorporate comments provided by the CENRAP Workgroups.

APPENDIX C
CENRAP STATE POPULATION PROJECTIONS

Table C-1. CENRAP State Population Projections

Mollie Freebairn
Carlton Flowers

Table of Contents

1.0 INTRODUCTION

1.1 Purpose of Study

The objective of this report is to document the 2002 Area Source Inventory for the National Emissions Inventory due to EPA every three years. Included are emissions from numerous source categories in each county in the state of Missouri.

1.2 Sources of Emissions

For this inventory, emissions from area sources are estimated collectively for those sources and activities that are too small or too numerous to be handled individually in the point source inventory. Area sources of all criteria pollutant emissions and PM2.5 to be included in this inventory are shown in the following table:

Source Categories	SCCs	PM10	PM2.5	CO	VOC	NOX	SOX
Asphalt Paving	2461021000 2461022000				X		
Dry Cleaning	2420010999				X		
Architectural Surface Coating	2401001000				X		
Autobody Refinishing	2401005000				X		
Consumer/Commercial Solvent Use	2460000000				X		
Bakeries	2302050000				X		
Graphic Arts	2425000000				X		
Solvent Cleaning	2415000000				X		
Leaking USTs	2660000000				X		
Industrial Surface Coating	2401020000				X		
Vehicle Fires	2810050000	X		X	X	X	
Structure Fires	2810030000	X		X	X	X	
Pesticides	2461850000 2461870999				X		
Open Burning	2610030000 2610020000	X		X	X	X	
Wildfires	2810001000	X		X	X	X	
Gasoline Marketing	2501060050 2501060100 2501060201				X		
Landfills	2620030000				X		
Commercial/Marine Vessels	2505020000	X			X	X	
Coal Combustion	2104002000	X	X	X	X	X	X

Source Categories	SCCs	PM10	PM2.5	CO	VOC	NOX	SOX
	2103002000 2102002000						
Natural Gas Combustion	2104006000 2103006000 2102006000	X	X	X	X	X	X
LPG Combustion	2104007000 2103007000 2102007000	X	X	X	X	X	X
Fuel Oil Combustion	2104004000 2103004000 2102004000	X	X	X	X	X	X
Residential Wood Burning	2104008000	X	X	X	X	X	X

1.3 Area Source Estimation Methodologies

Several methodologies were available for estimating the area source activity and emissions: (1) apportioning national or state activity totals to local inventory area; (2) using per capita emission factors; (3) using emissions-per-employee factors; (4) surveying local activity levels; and (5) treating area sources as point sources. Following the methodologies outlined in the Emission Inventory Improvement Program's (EIIP) guidance, appropriate data were collected for each source.

1.4 Allocating Missouri Employees to the Commercial and Industrial Sectors

The North American Industry Classification System (NAICS) is in the process of replacing the Standard Industrial Classification (SIC). Commercial/Institutional sources which were previously designated to be SIC categories 50 through 99, are now designated as NAICS categories 11, and 42-92, as shown in the table below. Industrial sector employment is aggregated for those Missouri employees found working in the NAICS categories 21-33 by the U.S. Census Bureau at http://quickfacts.census.gov/qfd/states/29000.html.
Missouri Department of Economic Development / Economic Research and Information Center employment data for 2002 is at http://www.ded.mo.gov/cgi-bin/meric/es202.pl.

SIC / NAICS Commercial/Institutional & Industrial Categories:
SIC to NAICS Correspondence:

SIC	NAICS	Category	NAICS 11, 42-92 Commercial/Institutional	NAICS 21-33 Industrial
01-09	11	Agriculture, Forestry, Fishing, & Hunting	X	
10-14	21	Mining		X
49	22	Utilities		X
15-17	23	Construction		X

20-39	31-33	Manufacturing		X
50-51	42	Wholesale Trade	X	
52-59	44-45	Retail Trade	X	
41-47	48-49	Transportation and Warehousing	X	
48	51	Information	X	
60-64	52	Finance and Insurance	X	
65-67	53	Real Estate and Rental and Leasing	X	
73,87	54	Professional, Scientific and Technical Services	X	
67	55	Management of Companies and Enterprises	X	
87,78	56	Administrative and Support and Waste Management and Remediation Services	X	
82	61	Educational Services	X	
80	62	Health Care and Social Assistance	X	
79	71	Arts, Entertainment and Recreation	X	
70	72	Accommodation and Food Services	X	
75	81	Other Services (except Public Administration)	X	
91-97	92	Public Administration	X	

1.5 Rule Effectiveness

A rule effectiveness (RE) factor was applied to base year emissions for counties where regulations were in place. RE is a measure of the ability of a regulatory program to achieve all emissions reductions that could be achieved by full compliance with the applicable regulations at all sources at all times. It reflects the assumption that regulations are not 100% effective.

1.6 Double Counting of Emissions

A major concern in the development of an area source inventory is the possibility of double counting emissions. Because some area source methodologies estimate emissions from all sources within a category, emissions already listed in the point source inventory may also be included in the area source inventory. In developing the Missouri area source inventory, possible double counting of emissions was avoided by subtracting emissions appearing in the Missouri state point source inventory from the area source totals for that category (*e.g.,* large dry cleaning facilities, large graphic arts facilities, *etc.*).

1.7 Quality Assurance

To ensure that this emissions inventory if of high quality, certain quality assurance (QA) procedures were implemented at various points in the inventory process. The following quality assurance techniques were used:

- Each algorithm used to calculate emissions was reviewed to ensure its appropriateness and adherence to EIIP guidance.

- Each spreadsheet was reviewed to ensure the proper data, emission factors and algorithms were used.
- Peer review was an essential part of the QA
- All emissions estimates were checked for reasonableness.
- All emissions estimation methods, data collected and emissions calculations were reviewed again during the reporting stage.
- The final data was run through the EPA quality assurance software to identify any errors that occurred as the data was put into NIF format before submission.

The emissions estimates were compared to emissions calculated in 1999 for any large increases or decreases. If there were significant differences in the three-year period the data was subjected to further investigation to ensure accuracy.

1.8 Federal, State and Local Regulations

Federal, State of Missouri and St. Louis area air pollution regulations were reviewed for application to specific area source categories. As shown in the following sections, these regulations have contributed a lot to emission reductions. Categories addressed by these regulations include:

- Commercial and Consumer Products Solvent
- Auto Body Refinishing
- Underground Storage Tanks
- Vehicle Fueling
- Tank Truck Unloading
- Solvent Metal Cleaning
- Dry Cleaning
- Cutback Asphalt Paving
- Open Burning
- Bakery Ovens
- Traffic Coatings

2.0 EMISSIONS ESTIMATES

2.1 Asphalt Paving

2.1.1 Source Description and Emission Controls

Asphalt paving is used to pave, seal, and repair surfaces such as roads, parking lots, drives, walkways, and airport runways. Asphalt concrete used in paving is a mixture of asphalt cement, which is a binder, and an aggregate. Asphalt cement is the semi-solid residual material left from petroleum refining after the lighter and more volatile fractions have been distilled out. Hot-mix asphalt is a mixture of heated asphalt cement and aggregate. Asphalt cutbacks are asphalt cements thinned with petroleum distillates (diluents). Asphalt emulsions are mixtures of asphalt cement with water and emulsifiers. Aggregates used in asphalt cements are typically rock gravel or recycled asphalt pavement, but can also be byproducts from metal ore refining processes.

Aggregate may constitute up to 95 percent by weight of the total mixture. Mixture characteristics for asphalt concrete are determined by the amount and grade of asphalt cement used, the addition of solvent- or soap-based liquefying agents, and the relative amount and types of aggregate used.

Recycled asphalt pavement (RAP) is being used more frequently, partly as a move to reduce solid waste. One source estimates that 90 percent of asphalt processed is RAP. To reuse the asphalt, the RAP is typically pulverized; sorted; mixed with recycling agents such as lime or calcium chloride, or additional aggregate; then applied. The five methods of recycling are: cold planing, hot recycling, hot in-place recycling, cold in-place recycling, and full depth reclamation. All except hot recycling occur at the location where paving is to be done, although material removed during cold planing may be processed at an asphalt plant.

Asphalt concrete is grouped into three general categories: hot-mix, cutback, and emulsified. Each is discussed below.

Hot-Mix Asphalt:

Hot-mix asphalt is the most commonly used paving asphalt for surfaces of 2 to 6 inches thick. Hot-mix asphalt is prepared at a hot-mix asphalt plant by heating asphalt cement before adding the aggregate. To maintain a liquid mixture, these plants must be near to the paving site. In some cases, mobile facilities are used.

Cutback Asphalt:

Cutback asphalt is used in tack and seal operations, in priming roadbeds for hot-mix application, and for paving operations for pavements up to several inches thick. In preparing cutback asphalt, asphalt cement is blended or "cut back" with a diluent, typically from 25 to 45 percent by volume of petroleum distillates, depending on the desired viscosity. Cutback asphalt is prepared at an asphalt plant. There are three types of cutback asphalt cement:

- Rapid Cure (RC) which uses gasoline or naphthas as diluents;
- Medium Cure (MC) which uses kerosene as a diluent; and
- Slow Cure (SC) which uses low volatility fuel solvents as diluents.

Emulsified Asphalt:

Emulsified asphalt is used in most of the same applications as cutback asphalt but is a lower emitting, energy saving, and safer alternative to the cutback asphalt. Instead of blending asphalt cement with petroleum distillates, emulsified asphalt uses a blend of asphalt cement, water and an emulsifying agent, such as soap. Such blends typically contain one-third water, two-thirds asphalt cement and minor amounts of an emulsifier. Some emulsified asphalt may contain up to 12 percent organic solvents by volume. Emulsification is done at an asphalt plant. Emulsified asphalt cures by two methods: water evaporation and, in the case of cationic and anionic emulsions, ionic bonding.

2.1.2 Emission Estimation Methodology

Activity Level

The Missouri Department of Transportation (MODOT) keeps records of amount cutback and emulsified asphalt used in 10 Districts. Since MODOT does not keep records for each county, population figures were used to estimate how much asphalt was used for each county.

Emission Factors

Missouri Department provided all Safety Material Data Sheets (MSDSs) for all types of asphalt used in 2002. Alternative Method 1 of EIIP volume III, Asphalt Paving, was used to come up with emission factors for cutback asphalt. Due to lack of data available for emulsified asphalt an emission factor of 9.2 lb VOC/barrel asphalt used (9.2 lb VOC/350 lb asphalt) was used to calculate VOC emissions from the use of emulsified asphalt in paving activities which was obtained from EIIP volume III.

Assumptions

It was assumed that 5% of asphalt paving was conducted by agencies other than the state's Department of Transportation. After some search on asphalt application practices, it was determined that cutback asphalt is typically applied during November through March. Moreover, emulsified asphalt is typically applied only in warm weather. This corresponds to the months of May through September. Since there is a rule that bans applying cutback asphalt during ozone season in St. Louis Area, it was assumed that there is 80% compliance with this rule.

Sample Calculation (Cole County)

<u>Cutback Asphalt:</u>

VOC Emissions (tons/year) = amount of cutback asphalt (gallons) X population of county / population of district X volume % of diluent X density of diluent X weight % of diluent evaporated / (2000 lb/ton)

Population of Cole County: 71894

Population of Central District: 461578

Types of Asphalt Used in Central District : MC-250 & MC-30

Amount of MC-250 & MC-30 Used in Central District: 64659 gallons

Volume Percent of Diluent: 19%

MC Diluent Density: 6.6755 lb/gallon

Weight Percent Diluent Evaporated: 70%

Activity Days Per Week: 5

Weeks Per Year Used (November to March): 39

VOC Emissions (tons/year) = 64659 gallons X 71894 / 461578 X 0.19 X 6.6755 lb/gallon *.7 / 2000lb/ton = 4.47 tons/year

Emulsified Asphalt:

VOC Emissions (tons/year) = amount of emulsified asphalt (gallons) X density of asphalt (lb/gallon) X Emission Factor (lb/lb) / 2000

Population of Cole County: 71894

Population of Central District: 461578

Amount of Emulsified Asphalt Used in Central District: 7,001,817 lb

VOC Emission Factor = 9.2 lb VOC/350 lb emulsified asphalt

Activity Days Per Week: 7

VOC Emissions (tons/year) = 7001817 X 71894/461578 X 9.2 lb/350 lb / 2000 lb/ton = 14.33 tons/year

2.1.3 Results

The total VOC emissions from asphalt paving for the State of Missouri is 1270.4 tons/year.

2.2 Dry Cleaning

2.2.1 Source Description and Emission Control

Dry cleaning is considered a solvent evaporation emission source of VOC. It involves the cleaning of fabrics with non-aqueous organic solvent. The industry is divided into three sectors: coin-operated facilities; commercial operations; and industrial cleaners. Volatile organic solvents that are used as cleaning solvents are emitted during the dry cleaning process. The petroleum solvents most commonly used in dry cleaning are Stoddard solvent (mineral spirit) and 140-F. The synthetic solvents that are used in dry cleaning, PERC, TCA, and CFC-113, are not considered photochemically reactive and should not be included as a source of VOC emissions; PERC and TCA, however, are hazardous air pollutants that should be included in an air toxic inventory. TCA and CFC-113 are ozone-depleting substances, and CFC-113 may be listed in some state regulation as a toxic air pollutant. It is estimated that 82% of all dry cleaning facilities use PERC, 15% use petroleum solvents, 3% use CFC-113, and less than 1% use TCA. However, based on study of national solvent use, 57% of al dry cleaning solvents are petroleum solvents, 39% of the solvents are PERC, and 3 and 1% are TCA and CFC-113, respectively, with a minor amount of unspecified solvents. Small dry cleaning facilities, such as coin-operated sites use PERC exclusively, and larger facilities, such as commercial facilities use petroleum solvents, resulting in this disparity.

2.2.2 Emission Estimation Methodology

Activity Level

The number of employees in dry cleaning facilities with SIC 7216 was used to estimate VOC emissions. The number of employees was obtained from the U.S. Bureau of Census.[1]

Emission Factors

The Emission factor (1800 lb/employee/year) was obtained from EIIP, Dry Cleaning. This emission factor excludes emissions of PERC, TCA, and CFC 113.

Assumptions

It was assumed that coin-operated dry cleaners use PERC exclusively and 15 percent of the remaining dry cleaners use petroleum solvents. According to EIIP volume III[2], there is no seasonal adjustment factor for dry cleaning. In addition, the activity days per week are 5 days.

Sample Calculation (Cole County)

VOC Emissions (tons/year) = [(# of employees) X (percent of facilities using petroleum solvents) X (emission factor) / (2000 lb/ton)

Emission Factor: 1800 lb VOC/employee/yr

Number of Employees with SIC 7216 in Cole County: 59

Percent of Facilities with SIC 7216 that use Petroleum Solvents: 15%

Activity Days Per Week: 5

VOC Emissions (tons/year) = 59 employees X 0.15 X (1800 lb/employee/yr) / (2000 lb/ton) = 7.97 tons/year

2.2.3 Results

Total VOC emissions from dry cleaners for the State of Missouri is 582.26 tons/year.

2.2.4 References

- *U.S. Census Bureau, Department of Commerce, Washington, D.C.*

2.3 Architectural Surface Coating

2.3.1 Source Description and Emission Control

Architectural surface coating is considered a solvent evaporation emission of volatile organic compounds (VOC) and is categorized as non-industrial surface coating. Architectural surface coatings, trade paints, are used primarily by homeowners and painting contractors to coat the interior and exterior of houses and buildings and the surfaces of other structures such as pavements, curbs and signs. Volatile organic compounds that are used as solvents in the coatings are emitted during the application of the coating and as the coating dries. The amount of coating used and the VOC content of the coating are the factors that primarily determine emissions from architectural surface coating operations. Secondary sources of VOC emissions are from the solvents used to clean the architectural coating application equipment and VOC released as reaction byproducts while the coating dries and hardens. The resins used in a particular coating determine VOC emitted from this chemical reaction. Since the use of organic solvents in architectural surface coatings is the primary source of emissions, control techniques for this source category involve either product substitution or product reformulation.

2.3.2 Emission Estimation Methodology

Activity Level

The Activity level is based on population and estimated gallons of paint (solvent and water based) used nation wide.[1]

Emission Factors

Emission factors for solvent based and water based paints are 3.87 lb/gallon and 0.74 lb/gallon respectively. All emission factors were obtained from EIIP volume III.[2]

Assumptions

A per capita emission factor was used to calculate emissions from this source category. This per capita usage factor is calculated by dividing the total usage of surface coating materials by the United States population. Activity was also assumed to be uniform 365 days per year.

Sample Calculation (Cole County)

Using the alternative method from the EIIP Volume III, Chapter3[3], the estimated ozone season daily VOC emissions from Cole County can be illustrated as follows:

VOC Emissions (tons/year) = population of county X [(per capita water based factor X water based emission factor) + (population of county X per capita solvent based factor X solvent based emission factor)] / (2000 lbs/ton)

US Population: 288,368,698

Total Paint-water based (gallons): 589,527,000

Total Paint-solvent based (gallons): 119,914,000

Per Capita-water based factor = 589527000 / 288368698 = 2.044 gallons/person

Per Capita-water based factor = 119914000 / 288368698 = 0.416 gallons/person

Paint-water based Emission Factor: 0.74 lb/gallon

Paint-solvent based Emission factor: 3.87 lb/gallon

Population of Cole County, 2002: 71,894

Activity Days per Week: 7

VOC Emissions (ton/year) = 71894 persons X (2.044 gal/person/yr X 0.74 lb/gal + 0.416 gal/person/yr X 3.87 lb/gal) / (2000 lbs/ton) = 112.23 tons/year

2.3.3 Results

Total VOC emissions from architectural surface coating for the State of Missouri is 8855.2 tons/year.

2.4 Auto Body Refinishing

2.4.1 Source Description and Emission Control

Auto body refinishing operations consist of four steps: (1) vehicle preparation, (2) primer application, (3) topcoat application, and (4) spray equipment cleaning. VOC emissions from automobile refinishing are influenced by several factors. Emissions from surface preparation and coating applications are a function of VOC content of the product used. Emissions are also a function of the transfer efficiency of the spray equipment. Transfer efficiency is the percent of paint solids that actually adheres to the surface being painted. Equipment with lower transfer efficiency would require more material to be sprayed, thus, increasing VOC emissions. Emissions from cleaning operations are dependent on the type of cleanup and housekeeping practices used. There are six main approaches for reducing VOC emissions from auto-body refinishing shops: use of lower-VOC coatings, use of enclosed cleaning devices, increased transfer efficiency, use of lower-VOC primers, use of solvent recovery system, and use of add-on controls for their spray booths such as thermal incineration, catalytic incineration, and carbon absorption. Other housekeeping activities can also be used to reduce emissions from auto body refinishing operations. These activities include tight fitting containers, reducing spills, mixing paint to need, providing training, maintaining rigid control of inventory, etc.

2.4.2 Emission Estimation Methodology

Activity level

The estimated national VOC emissions from auto body refinishing was apportioned to inventory area using employment data with 7532 SIC obtained from Department of Commerce. Data for 2002 was not available therefore data from 1999 was used for purposes of calculation an emission factor only.

Emission Factors

The emission factor is the number of employees in the inventory area divided by the number of employees nationwide with 7532 SIC.

Assumptions

It was assumed that the National VOC emissions from auto body refinishing are directly proportional to employment. It was assumed that the national EPA regulation promulgated on

September 11, 1998 to control VOC emissions from the use of Automobile refinishing coatings would reduce emission by 37%.

Sample Calculation

VOC Emissions (tons/year) = [(# employees in inventory area) / (# employees nation wide) X (national VOC emissions from auto body refinishing) X percent reduction from regulation] / (2000 lb/ton)

Estimated National VOC emissions: 79429.39 tons

Number of Employees Nationwide: 205172

Number of Employees in Cole County: 60

Activity Days Per Week: 5

Percent Emissions Reduction from Regulation: 37%

VOC Emissions (tons/year) = National VOC Emissions / Number of Employees Nationwide X Number of Employees in Cole County = 79429.39 / 205172 X 60 = 23.23 tons/year.

2.4.3 Results

The total VOC emissions from auto-body refinishing in the State of Missouri for 2002 is 1827.0 tons.

2.4.4 References

2.5 Commercial/Consumer Solvent Use

2.5.1 Source Description and Emission Control

Solvents contained in consumer and commercial products are primarily released during product use. Commercial and consumer products included in this category are:

- Household products
- Toiletries
- Aerosol products
- Rubbing compounds

- Windshield washing fluids
- Polishes and waxes
- Non-industrial adhesive
- Space deodorants
- Moth control
- Laundry detergents and treatment

Organic compounds in these products may act either as the carrier for the active product ingredients or as the active ingredients themselves. The organic compounds may be released to the atmosphere through immediate evaporation of an aerosol spray, evaporation after application or direct release in the gaseous phase.

Potential control strategies for VOC emissions from consumer and commercial products include a change in the application method, product substitution, product reformulation, and directions for use, storage, and disposal.

2.5.2 Emission Estimation Methodology

Activity Level

Emissions from consumer and commercial products were estimated using a single per capita emission factor from EIIP volume III, Chapter 5 and population data obtained from the United States Bureau of Census.

Emission Factor

The per capita emission factor for commercial and consumer solvent use is 6.06 lbs./capita/yr. The emission factor was adjusted from 7.84 to 6.06 to avoid double counting with pesticide applications.

Assumption

VOC emissions are proportional to population. It was assumed that the EPA consumer and commercial products regulation finalized on March, 1996 would reduce emissions by 20%.

Sample Calculation (Cole County)

VOC Emissions (tons/year) = population X emission factor X Percent Reduction from Regulation

VOC Emission Factor: 6.06 lb/person/yr

Population of Cole County: 71,894

Percent Reduction of Emission from EPA Regulation: 20%

Activity Days Per Week: 7

Percent Emissions Reduction from Regulation: 20%

VOC Emissions (tons/year) = 71894 persons X 6.06 lb/person/y) X (1 – 0.20) / (2000 lb/ton) = 174.271 tons/year.

2.5.3 Results

The total VOC Emissions from Consumer/Commercial Solvent Use for the State of Missouri is 13750.3 tons/year.

2.6 Bakeries

2.6.1 Source Description and Emission Control

The major pollutants emitted from bread baking are VOC emissions, chiefly the ethanol produced as a byproduct of the leavening process. Commercial bread bakeries use four basic dough processes: sponge and dough, straight dough, liquid ferment methods, and no-time dough. Bread in its simplest form requires four ingredients: flour, water, yeast, and salt. The primary emission source at a bakery is the oven. Because the ethanol produced by yeast metabolism is generally liquid at temperature below 77 ^{o}C or 170 ^{o}F, it is not emitted in appreciable amounts until the dough is exposed to high temperature in the oven. Bakery products that are not leavened with yeast do not produce ethanol and should not be considered for the VOC inventory.

2.6.2 Emission Estimation Methodology

Activity Level

VOC emissions from bakeries in Missouri counties were estimated using an employment based emission factor. This emission factor encompasses emissions from liquid ferment, sponge and dough methods. The total amount of VOC emitted by each county was calculated by multiplying the emission factor with the number of employees. The employees for each county were based on the NAICS numbers 3188 obtained from the U.S. Census Bureau.

Emission Factor

The emission factor of 220 tons VOC per employee-year was derived by Radian Corporation in the 1980's.

Assumption

It was assumed that bakery production does not vary from season to season and that the activity days per week are 6 days.

Sample Calculation (Boone County)

VOC Emissions (tons/year) = (# employees - # point source employees) X (emission factor) / 2000 lbs/ton.

Bakeries Employment in Boone County: 59 employees

Bakeries Point Source Employment in Boone County: 0

Emission Factor: 220 lb/employee/yr

Activity Days Per Week: 6

VOC Emissions (tons/year) = (59 – 0) employees X (220 lb/employee/yr) / (2000 lb/ton) = 6.49 tons/year.

2.6.3 Results

The total VOC emissions from bakeries for the State of Missouri is 499.18 tons/year.

2.7 Graphic Arts

2.7.1 Source Description and Emission Control

Graphic arts is considered a solvent evaporation source of VOC emissions and includes the printing of news letters, books, magazines, fabric, wall covering and other materials. Graphic arts

operations are performed on printing presses that are made up of one or more "units". Each unit can print only one color. The substrate in graphic arts operations is either continuous and called a "web," or individual pieces of substrate called "sheets." The pattern that is printed on the substrate is called the "image." Five basic processes are used in the printing industry, including flexography, letterpress, lithography, rotogravure, and screen process printing. Considerable emissions originate from minor graphic arts applications, including in-house services in nonprinting industries. The predominant emissions from graphic arts printing are VOC contained in the printing inks, fountain solutions and cleaning solutions. Emissions from proofing presses, cleaning operations, ink storage tanks, and ink mixing operations are relatively minor compared to the emissions during the printing process, but they do contribute to overall emissions.

Afterburners, both thermal and catalytic, can be used to control VOC emissions from the heatset web offset lithography, rotogravure printing, and flexography. Refrigeration of the dampening solution is a process change that can achieve approximately 40 percent reduction of the VOC emissions. The use of lower- VOC-containing cleaning solutions can reduce VOC and hazardous air pollutants (HAP) emissions from cleaning operations in all types of printing. Storing cleaning rags in closed containers can control some of the fugitive emissions from cleaning.

2.7.2 Emissions Estimation Methodology

Activity Level

Ink sales nationwide were used to estimate emission from this source category. Ink sales in pounds were obtained from the U.S. Bureau of Census web site. The procedure to estimate emissions from this source category is outlined in EIIP, volume III, Graphic Arts. Given the time limitation and available resources, the first alternative method was used.

Emission Factors

The following emission factors were obtained from EIIP, volume III, Graphic Arts.

Printing Type	% Printing Type	Component Emission Factors Pound VOC Emitted per Pound of Ink Used		
		Ink	Fountain Solution	Cleaning Solution
Rotogravure	22	0.70	NA	0.03
Flexography	16	0.60	NA	0.04
Offset Lithography	35	0.38	2.75	1.23
Letter Press	8	0.24	NA	0.07
Screen	19	0.12	NA	

Assumptions

Number of employees was assumed to be proportional to ink sales.

Sample Calculation

OSD VOC (lb) = (# employees in county – county point source # employees) / total area source # employees X (Total area source ink usage) X ((% rotogravure ink solvent X rotogravure emission factor) + ((% flexography ink solvent X flexography emission factor) + …) / (activity days per week) X (1 yr / 52 week) X (seasonal activity factor) / 0.25

Total Ink Sales in US: 1642500000 lb

Printing Employment in US: 1501714

Printing Employment in State: 43952

Total Ink Sales in State: 48072509.15 lb

Point Source Ink Usage: 45122344.60 lb

Total Area Source Ink Usage: 2950164.54lb

Total Area Source Printing Employment: 21585

Franklin County Printing Employment: 999

Franklin County Point Source Printing Employment: 231

Activity Days Per Week: 5

Seasonal Activity Factor: 0.25

OSD VOC = (999 – 231) / 21585 X 2950164.54 lb X ((0.22 X 0.73) + (0.16 X 0.64) + (0.35 X 4.36) + (0.08 X 0.31) + (0.19 X 0.12)) / (5 days / week) X (1 yr / 52 week) X 0.25 / 0.25 = 741.48 lb/day

2.8 Solvent Cleaning

2.8.1 Source Description and Emission Control

Degreasing operations are considered solvent evaporation emission sources of VOC and employ non-aqueous solvents to remove grease, fats, oil, wax or soil from the surface of metal, glass or plastic articles which are to be electroplated, painted, repaired, inspected, assembled or machined. Degreasing is not associated with any particular industry, but is used in a variety of industries. There are three types of degreasers: small cold cleaners; open top vapor degreasers; and conveyorized degreasers. Open top vapor degreasers and conveyorized degreasers are usually large enough to be considered as point sources of emissions; therefore, only cold cleaners were evaluated for this area source report.
Design features that control solvent emissions from batch cold cleaning machines include increased freeboard ration, covers, internal drainage rack, and visible fill line.

2.8.2 Emission Estimation Methodology

Activity Level

EIIP Volume III, Chapter 6 discusses several methods that can be used to estimate emissions. Given the available data and time limits, the emission factor alternative method was used.

Emission Factor

A per employee emission factor, 87 lb/employee, for total solvent cleaning was used to estimate VOC emissions from solvent cleaning operations.

Sample Calculation

VOC Emissions ton/year = (population of county / population of State X # of Employees in State) X (emission factor)

Population of Cole County: 71894

Population of State of Missouri: 5,672,579

# of Employees in State for Solvent Cleaning: 268,228

Emission Factor: 87 lb/employee/yr

VOC Emissions ton/year = (71894 / 5672579 X 268228) employees X (87 lb/employees/yr) / (2000 lb/ton) = 147.88 tons/year.

2.8.3 Results

The total VOC emissions from solvent cleaning in the State of Missouri is 11667.92 tons/year.

2.8.4 References

2.9 Leaking Underground Storage Tank Removal

2.9.1 Source Description and Emission Control

Leaking underground storage tanks are typically not considered a quantifiable source of emissions until excavation and remediation efforts begin. The majority of air emissions from leaking UST site remediations occur during initial site action, which is typically tank removal. During tank removal, the leaking tank and the surrounding soil are removed and the soil is either treated on-site or transported off site for treatment or disposal in a landfill. Emissions from the soil occur as the tank is being removed and when soil is deposited on the ground before treatment/disposal occurs. The magnitude of VOC emissions during remediation events depends on several factors, most of all which are specific to each site. For this reason, determining emissions for this activity is difficult. Factors influencing VOC emissions from soils include type, concentration, and distribution of contaminants in the soil, the porosity and moisture content of the soil, temperature, wind, shape, and surface area of the soil piles, the type of soil handling equipment used and the duration of the operation.

2.9.2 Emission Estimation Methodology

Activity Level

The number of leaking storage tanks removed in each county in 2002 was obtained from the Missouri Hazardous Waste Program Tanks Section.

Emission Factors

Alternative Method 1 of EIIP, Leaking Underground Storage Tanks was used to determine VOC emissions. An emission factor of 28 lb/day of remediation event was used in calculations.

Sample Calculation

VOC Emissions in tons/year = # of leaking USTs removed X 28 lb/day X # of days per removal / (2000 lb/ton)

Emission Factor: 28 lb/day

# of leaking USTs removed in Cole County: 3

Average # of days to remove tanks: 1

VOC Emissions tons/year = (3 tanks removed) X (28 lb/day/tank removed) X (1 day to remove) = .042 tons/year

2.9.3 Results

The total VOC emissions from the removal leaking underground storage tanks in the State of Missouri is 9.53 tons/year.

2.10 Industrial Surface Coating

2.10.1 Source Description and Emission Control

"Surface coating operations involve applying a thin layer of coating (e.g., paint, lacquer, enamel, varnish, etc.) to an object for decorative or protective purposes. The surface coating products include either a water-based or solvent-based liquid carrier that generally evaporates in the drying or curing process.

The use of surface coatings by manufacturing industries and other sectors of the economy is pervasive. Applications include: (1) coatings that are applied during the manufacture of a wide variety of products by Original Equipment Manufacturers (OEMs) including furniture, cans, automobiles, other transportation equipment, machinery, appliances, metal coils, flat wood, wire, and other miscellaneous products, (2) architectural coatings, and (3) special purpose coatings used for applications such as maintenance operations at industrial and other facilities, auto refinishing, traffic paints, marine finishes, and aerosol sprays. For area source purposes, the small industrial surface coating category includes OEM applications, some marine coatings, and maintenance coatings. This category does not include architectural surface coatings, traffic markings, automobile refinishing, or aerosols.

The main approaches for reducing VOC emissions from small industrial surface coating operations are (1) use of lower-VOC coatings, (2) use of enclosed cleaning devices, and (3) increased transfer efficiency. Other housekeeping activities can also be used to reduce emissions from small industrial surface coating operations. These activities include using tight-fitting containers, reducing spills, mixing paint to need, providing operator training, maintaining rigid control of inventory, using proper cleanup methods, etc.

2.10.2 Emission Estimation Methodology

Activity Level

Alternative Method 1 of EIIP volume III, Industrial Surface Coating, was used to estimate VOC emissions. This method is based on the national default per employee emission factors presented in Table 8.5-1 of EIIP volume III, Industrial Surface Coating.

Emission Factors

The following table represents emission factors based on SIC:

Category	SIC Code	Per Employee VOC Emission Factor (lb/yr)
Furniture and Fixtures	25	944
Metal Containers	341	6,029
Automobiles (new)	3711	794
Machinery and Equipment	35	77
Appliances	363	463
Other Transportation Equipment	37, except 3711 and 373	35
Sheet, Strip, and Coil	3479	2,877
Factory Finished Wood	2426-9, 243-245, 2493, 2499	131
Electrical Insulation	3357, 3612	290
Other Product Coatings	NA[a]	NA
High-Performance Maintenance Coatings	NA	NA
Marine Coatings	373	308
Other Special Purpose Coatings	NA	NA

[a]NA = not available, use per capita emission factors from Table 8.5-2

Assumptions

All industrial surface coatings are accounted for in the point source inventory.

2.10.3 Results

Since all emissions of VOC from industrial surface coating are accounted for in the point source inventory the amount of emissions for industrial surface coating in the area source inventory for the State of Missouri is zero.

2.11 Vehicle Fires

2.11.1 Source Description and Emission Control

This emissions source category covers emissions from accidental vehicle fires. Vehicles included are any commercial or private mode of transportation that are authorized for use on public roads. Non-roadway fires such as rail, water, and air transportation are not included. The pollutants emitted that are emitted from vehicle fires that are included in this inventory are PM, CO, and Nox.

2.11.2 Emission Estimation Methodology

Activity Level

Emissions from vehicle fires were calculated using the method suggested in the EIIP guidance document for vehicle fires. First the number of vehicle fires for each county was determined by apportioning national data locally using vehicle miles traveled. An emission factor was then used to determine the amount of pollutants emitted.

Emission Factors

Structural Fire Pollutants	Emission Factor (lbs./ton Material)
PM	100
CO	125
NOx	4

Assumptions

It was assumed that each vehicle has 500 pounds of components that can burn in a fire and that fires occur 7 days a week, 52 weeks a year.

Sample Calculation – Cole County

PM emissions (tons/year) = # of vehicle fires in US X (MO VMT/US VMT) X % of state VMT in Cole County/100 X 500 lb/fire / 2000 lb/ton X emission factor

Number of Vehicle Fires in US: 421440

National VMT: 2,799,258 million

Missouri VMT : 67,632 million

% State VMT in Cole County: 0.907%

PM Emission Factor: 100 lb/ton

Activity Days Per Week: 7

PM Emissions (tons/year) = 421440 Vehicle Fires in US X (67,632 million/2,799,258 million) X 0.907/100 X 500 lb/fire / 2000 lb/ton X 100 lb/ton / 2000 lb/ton = 1.15 tons PM

2.11.3 Results

The emissions from structural fires for the State of Missouri are as follows:

Table 1: Emissions from Structural Fires tons/year

PM	127.28
CO	159.2
NOX	5.09

2.12 Open Burning - Structure Fires

2.12.1 Source Description and Emission Control

Structural fires or building fires are considered a combustion source of VOC, NOx, CO, and PM emissions. Like forest wildfires, they can produce large amounts of emissions over a short period of time.

2.12.2 Emission Estimation Methodology

Activity Level

Emissions from structural fires were calculated using the second alternative method in *Procedures for the Preparation of Emission Inventories for Precursors of Ozone: Volume I* where an emission factor is applied to an estimate of the number of fires per county and a fuel loading factor (1.15 tons/fire). The number of fires per county was estimated by assuming that an average of 2.3 fires occur per 1,000 people.

Emission Factors

Structural Fire Pollutants	Emission Factor (lbs./ton Material)
VOC	11
CO	60
NOx	1.4
PM10	10.8

Assumptions

The number of fires per county was estimated by assuming that 2.3 fires occur per 1,000 people.

Sample Calculation – Cole County

VOC Emissions (tons/year) = population X # fires per 1000 people X emission factor X fuel loading factor / 2000 lb/ton

Population of Franklin County: 71894

Number of Fires: 0.0023 fire/person/yr

VOC Emission Factor: 11 lb/ton

Fuel Loading Factor: 1.15 tons/fire

Activity Days Per Week: 7

VOC Emissions (tons/year) = 71849 persons X 0.0023 fire/person/yr X 11 lb/ton X 1.15 tons/fire / 2000lb/ton= 1.046 ton/year

2.12.3 Results

The emissions from structural fires for the State of Missouri are as follows:

Table1: Emissions from Structural Fires tons/year

VOC	82.5
CO	450.1
NOX	10.5
PM10	81.0

2.13 Pesticide Application

2.13.1 Source Description and Emission Control

Pesticides are considered an evaporated source of VOC emission and are defined as any substance used to kill or retard the growth of insects, rodents, fungi, weeds or microorganism. Pesticides can be broken down into three chemical categories: synthetics, non-synthetics (petroleum products), and inorganic. Formulations of pesticides are made through the combination of the pest-killing material referred to as the active ingredient, and various solvents, which act as carriers for the pest-killing material, referred to as the inert ingredient. Both types of ingredients contain volatile organic compounds (VOC) that can potentially be emitted to the air either during application or as result of evaporation. The VOC emission rate is influenced by the formulation (solid or solution) and method of application. Pesticide application can be broken down into two users categories: Agricultural and non-agricultural, which includes municipal, commercial, and consumer.

2.13.2 Emission Estimation Methodology

Activity Level

Non-agricultural Pesticides:

Due to difficulties in obtaining accurate information related to non-agricultural pesticides, this category was not separated into municipal, commercial, and consumer subcategories. Emissions were estimated using alternative method 1 given in EIIP, volume III, chapter 9. The method is based on population.

Agricultural Pesticides:

The preferred method was used to estimate emissions form agricultural pesticide. The method is based on pesticide applied, the formulation of the pesticide, and the total acres to which the pesticide was applied. The acreage devoted to crops (alfalfa, corn, cotton, pasture, rice, sorghum, soybeans, tobacco, and wheat) for all counties in 2002 was determined from the state Department of Agricultural (State Crop Statistics, 2002). Pesticide usage data was obtained from the National Center for Food and Agriculture Policy (NCFAP) via the Internet. The data included the pesticide used for each crop, the number of acres treated, and the amount of active ingredient in each pesticide for 1992. Percent active ingredients and VOC contents ware obtained from Chemical & Pharmaceutical Press, Inc. via the Internet.

Emission Factors

Non-agricultural Pesticides:

The emission factor for non-agricultural pesticides is 1.78 pound per person. This emission factor encompasses emissions from municipal, commercial, and consumer pesticide use and was taken from Table 5.4-1 of Chapter 5 (Consumer Solvent Use) of EIIP volume III.

Agricultural Pesticides:

Emission factors are functions of application method and vapor pressure of pesticide active ingredients. Emission factors and typical vapor pressures for some of the active ingredients are given in tables 9.4-4 and 9.4-2 of EIIP, volume III, Pesticide – Agricultural and Non-agricultural, respectively.

Assumptions

It was assumed that the same kinds of pesticides used in 1992 were also used in 2002. It was also assumed that the difference in the amount of pesticide used in 2002 from 1992 is proportional to the difference in acres of crops harvested between 1992 and 2002. Missing active ingredients and VOC contents for some the pesticides were assumed to be 50% each.

Sample Calculation (Cole County)

VOC Emissions (tons/year) = non-agricultural VOC Emissions + agricultural VOC Emissions

Non-agricultural Pesticides:

Population of Cole County: 71894 persons

Emission Factor: 1.78 lb/person/yr

Activity Days Per Week: 6 days

VOC Emissions (ton/year) = population X emission factor = 71894 X 1.78 / 2000 = 63.99 tons/year

Agricultural Pesticides:

Total Pesticides Applied for Sorghum in Missouri

Pesticide	Acres treated	Pounds of active ingredient
2,4-D	43200	27648
ALACHLOR	122400	210528
ATRAZINE	619200	780192
BROMOXYNIL	7200	2376
GLYPHOSATE	14400	10224
METHOLACHLOR	237600	358776
PROPACHLOR	79200	250272
CARBARYL	36000	36000
CARBOFURAN	28800	24192
CHLORPYRIFOS	14400	10224
DIAZINON	14400	7200
MALATHION	21600	21600
METHOMYL	7200	3600
PHORATE	7200	8064
TERBUFOS	7200	5760
Total	1 260 000 Acres	1 756 656 lbs. AI.

Vapor Pressure of 2,4-D: 8.0×10^{-6}

Application Method: Soil Incorporation

Emission Factor: 5.4 lb/ton

Percent Active Ingredient (%A.I.): 47.9

Percent Inert Ingredient: 52.1

Pesticide Applied: 27648 lb /0.479 X 1.13 = 16450 lb

Inert Ingredient VOC Content: 21%

Activity Days Per Week: 6 days

VOC Emissions ton/year = Sum[pesticide applied (lb) X [fraction active ingredient X emission factor/2000 + fraction inert ingredient X fraction VOC in formulation]/2000

VOC Emissions from 2,4-D (tons/year) = 16540 lb/year X [0.479 X 5.4 lb/ton / 2000 + 0.521 X 0.21] / = .9 tons/year

VOC Emissions (lb/ozone season day) from 2,4-D = .9 tons/year X (.233/.25) / (6*52) = 7.732 lb/osd

Total VOC Emissions (tons/year) from all pesticide applied to Sorghum = 102.7 tons/year

Total VOC Emissions (tons/year) from all pesticide applied to Sorghum in Cole County = Total VOC Emissions X Total Harvested Sorghum Acres in Franklin County / Total Harvested Sorghum Acres in Missouri

Total Harvested Sorghum Acres in Cole County: 180

Total Harvested Sorghum Acres in Missouri: 153985

VOC Emissions for Cole County for all pesticide applied to Sorghum ton/year = 102.7 ton/year X 180/153985 = .12 tons/year

Total VOC Emissions from all pesticide applied to all crops in Cole County = 10.11 ton/day.

Total VOC Emissions from Agricultural and Non-agricultural pesticide applied in Cole County = 10.11 tons/year + 63.99 ton/year = 74.1 lb/day.

2.13.3 Results

The total VOC emissions from pesticide application for the State of Missouri is 10997.4 ton/year.

2.14 Open Burning- Residential Solid Waste

2.14.1 Source Description And Emission Control

Open burning is considered a combustion source of VOC, NOx and CO emissions. Open burning may be done in open drums or baskets, yards or dumps. The most effective control technique of open burning emissions is to ban open burning and require management of these wastes by other methods.

2.14.2 Emission Estimation Methodology

Activity Level

Residential Municipal Solid Waste (MSW) Burning

Emission estimates for residential MSW burning were developed by first estimating the amount of waste generated for each county in the United States. The amount of waste generated was estimated using a national average per capita waste generation factor, which is 3.31 lbs/person/day (.6 tons/person/year). To better reflect the actual amount of household residential waste subject to being burned, non-combustibles (glass and metals) and yard waste generation were subtracted out. This factor was then applied to the portion of the county's total population that is considered rural based on 1990 Census data on rural and urban population, since open burning is generally not practiced in urban areas.

For rural populations, it is estimated that 25 to 32 percent of the municipal waste generated is burned. A median value of 28 percent was assumed for the nation, and this correction factor was applied to the total amount of waste generated.

Controls (or burning bans) were accounted for by assuming that no burning takes place in counties where the urban population exceeds 80 percent of the total population (i.e., urban plus rural). Zero open burning emissions were attributed to these counties.

Residential Yard Waste Burning

A national per capita waste generation average daily value of 0.117 tons yard waste/person/year was used as the basis for yard waste open burning emissions. It was assumed that 28 percent of the total yard waste generated is burned and that burning occurs primarily in rural areas.

Controls (or burning bans) were accounted for by assuming that no burning takes place in counties where the urban population exceeds 80 percent of the total population (i.e., urban plus rural). Zero open burning emissions were attributed to these counties.

Emission Factors

Emissions factors for VOC, NOx, CO, and PM10 were obtained from AP- 42 (Table 2.5-1).

	VOC	NOx	CO	PM10
MSW	30	6	85	38
Yard Waste	28	4	140	38

Sample Calculation (Cole County)

Waste Generation Factor (MSW) = .604 tons/person/year

Waste Generation Factor (Yard Waste) = .117 tons/person/year

Population = 71,894

% Rural = 31%

% Waste Generated that is Burned (MSW and Yard Waste) = 28%

MSW Burning PM10 Emissions (tons/year) = Population X % Rural X Waste Generation Factor X % Waste that is Burned X PM10 Emission Factor / 2000

MSW Burning PM10 Emissions (tons/year) = (71894) X (.31) X (.604) X (.28) X (38) / 2000 = 71.26 tons/year

Yard Waste Burning PM10 Emissions (tons/year) = Population X Yard Waste Generation Factor X % Rural X % of Waste that is Burned X PM10 EF /2000

Yard Waste Burning PM10 Emissions (tons/year) = (71894) X (.31) X (.117) X (.28) X (38) / 2000= 13.87 tons/year

2.14.3 Results

Total emissions from open burning of municipal solid waste and yard waste for the State of Missouri are as follows:

	VOC (ton/yr)	Nox (ton/yr)	CO (ton/yr)	PM10 (ton/yr)
MSW	4120.34	6824.07	11674.29	5219.09
Yard Waste	748.65	106.95	3743.27	1016.03

2.15 Open Burning-Forest/Wild Fires

2.15.1 Source Description and Emission Control

A wildfire is a large-scale natural combustion process that consumes various ages, sizes, and types of flora growing outdoors in a geographical area. Consequently, wildfires are potential sources of large amounts of air pollutants that should be considered when trying to relate emissions to air quality.

The size and intensity, even the occurrence, of a wildfire depend directly on such variables as meteorological conditions, the species of vegetation involved and their moisture content, and the weight of consumable fuel per acre (available fuel loading). Once a fire begins, the dry combustible material is consumed first. If the energy release is large and of sufficient duration, the drying of green, live material occurs, with subsequent burning of this material as well. Under proper environmental and fuel conditions, this process may initiate a chain reaction that results in a widespread conflagration.

The complete combustion of wildland fuels (forests, grasslands, wetlands) require a heat flux (temperature gradient), adequate oxygen supply, and sufficient burning time. The size and quantity of wildland fuels, meteorological conditions, and topographic features interact to modify the burning behavior as the fire spreads, and the wildfire will attain different degrees of combustion efficiency during its lifetime.

This area source inventory will describe the procedures and applied approach for estimating emissions from this area source of forest fires.

2.15.2 Emission Estimation Methodology

Activity Level

An alternative method was used rather than the two methods provided in the Wildfires and prescribed Burning, EIIP volume III. County emissions from wildfires were calculated based on

an annual report, submitted to the Missouri Department of Conservation, from each county reporting the number of acreage burned.

Emission Factors

The following table lists emission factors from the EPA AP-42

Pollutant	Emission Factor (Lbs./ton)	Fuel Loading Factor (tons/acre)
VOC	16	11
NOx	4	11
CO	140	11

Sample Calculation (Cole County)

VOC Emissions (tons/year) = # acres burned X fuel loading factor X Emission Factor / 2000.

Acres Burned in Cole County: 35 acres

VOC Emission Factor: 16 lb/ton

Fuel Loading Factor: 11 tons/acre

VOC Emissions (tons/year) = 35 acres X 11 ton/acre X 16 lb/ton / 2000 lb/ton = 3.1 ton/year.

2.15.3 Results

The emissions from forest fires for the State of Missouri are as follows:

VOC	4389.4 tons/year
CO	38407.6 tons/year
NOX	1097.4 tons/year

2.15.4 References

- “Assessment of Biomass Burning in the United States”, Bill Leenhouts, U.S. Fish and Wildlife Service, 1998.

2.16 Gas Distribution

2.16.1 Source Description and Emission Control

This area source category estimates the volatile organic compound (VOC) emissions resulting from the storage and transfer operations at gasoline dispensing facilities. Emissions from storage and transfer operations include the working losses and breathing losses from underground tanks, vapors displaced through vehicle refueling and spillage.

The area sources of evaporative VOC emissions from the distribution of gasoline that are covered in this category include the following:

- Truck in transit:

  Evaporation of gasoline vapor from loaded tank trucks during transportation of gasoline from the bulk plant/terminal to the service station or other dispensing outlet, and from empty tank trucks returning from service stations to bulk plant/terminals.

  - Stage I:

    Displacement of gasoline vapors from the storage tanks during the transfer of gasoline from tank trucks to storage tanks at the service station.

- Stage II:

  Displacement of gasoline vapors from vehicle gasoline tanks during vehicle refueling. Spillage of gasoline during either delivery activity above may also include. This loss includes prefill and postfill nozzle drip and spitback and overflow from the filler pipe of the vehicle's fuel tank during filling.

  - Storage tank working losses:

    Evaporation of gasoline vapors from the storage tank and from the lines going to the pumps during transfer of gasoline.

VOC emissions from this area source category are influenced by several factors. Fuel volatility measured as Reid vapor pressure (RVP) affects the evaporation rate of gasoline. The technology for loading tank trucks and tanks (splash loading, submerged loading, vapor balance, etc.) affects the release of displacement emissions. Tank characteristics (color and design) affect working losses from aboveground storage tanks.

Emissions from underground tank filling operations at service stations (stage I emissions) can be reduced by the use of a vapor balance system, which consists of a hose that returns gasoline vapors displaced from the underground tanks during filling back to the tank truck, as well as measures to ensure tightness of the truck. The control efficiency of the balance system can range from 93 to 100 percent.

Emissions from vehicle refueling (stage II emissions) also can be reduced by a vapor balance system. During refueling, the vapors displaced from the vehicle fuel tanks are returned to the underground tanks through the use of a special nozzle. Stage 1 controls have been implemented in attainment (Only in Kansas City) and five nonattainment areas. Stage II controls are required in five St. Louis ozone nonattainment areas.

2.16.2 Emission Estimation Methodology

Activity Level

Since volume of gasoline distribution at the county level and information such as sales tax data, gasoline sales data from fuel distributors and retailers are not available, vehicles miles travel (VMT) provided by the Missouri Department of Transportation is the only available information can be used to determine gasoline consumption. It should be noted that the disadvantage of using VMT is that it is a measure of vehicle activity in the area, not a measure of the fuel dispensed in the inventory area. VMT produced by vehicles simply passing through the area that did not refuel in the inventory region would tend to overstate the vehicle refueling activity level.

The VMT used for this inventory was taken from The Missouri Department of Transportation. This 2002 VMT count only takes into account state routes. In order to account for the off-system routes, an additional 30% was added to the state route VMT in order to produce an estimated total VMT for both state routes and off-system routes.

For the St. Louis Non-Attainment area, a much more reliable VMT was used. The East-West Gateway Coordinating Council sponsored a VMT study for the model year 2004. This study was completed by the East-West Gateway Council
of Governments travel demand model, which is currently maintained within CUBE VOYAGER modeling software. The method used is much more accurate and in-depth than the method used by MoDOT in estimating VMT. Therefore, it was used in-place of the MoDOT-generated VMT for the following counties:

- St. Louis City
- St. Louis County
- St. Charles County
- Jefferson County
- Franklin County

.

Emission Factors

- Gasoline truck in transit, fuel delivery to outlets and storage tank Breathing Emission Factors

Emission Source	lb/1000 gal. Throughput
Empty Tank Trucks[b] Full Tank Trucks[c]	0.005 0.005
Filling Underground Tank (Stage I) Submerged Filling Splash Filling Balanced Submerged Filling Underground Tank Breathing	 7.3 11.5 0.3 1.0

Source : AP-42 Tables 5.2-5, 5.2-7
b & c , Midpoint to typical range provided in AP-42

- Vehicle refueling emission factors

The MOBILE 6 model was used to generate refueling emission factors for gasoline and diesel-fueled vehicles, and emission factors for tailpipe emissions and refueling activities.

The emissions estimation methodologies for this area source category have the following relationship:

$$\text{Emission} = \text{Emission Factor} \times \text{Activity Level}$$

Where Activity level is total gasoline consumption. The Federal Highway Administration (FHWA) annually publishes Highway Statistics, which contains gasoline consumption data for each state.

Another approach can be used is to use information on annual emissions and fuel consumption for an "Average Passenger Car and Light Truck" published by the U.S. Environmental Protection Agency National Vehicle and Fuel Emissions Laboratory. Since MOBILE 6 is available, this approach was not considered in this study.

Assumptions

The report "1996 Daily Vehicle Miles of Travel Classified by District, County and System" provided by the Missouri Department of Highway Transportation and the "1995 Relationships – Population, Drivers, Vehicles, Fuel, and Travel " was used to derive the gasoline consumption distributed at each county of study in Missouri.

The effective emission reduction for Stage I and II vapor recovery systems is 95% control efficiency.

The average miles-per-gallon fuel efficiency of the gasoline-powered motor fleet. This value, 16.73 miles per gallon, taken from the 1995 Relationships table 5.1. Published by the Missouri Department of Highway and Transportation.

Using EIIP Volume III- Chapter 11 "Gasoline Marketing (Stage I and Stage II)" as a guide to estimate evaporative VOC emissions from the distribution of gasoline that are covered in this chapter.

Gasoline consumption is proportional to gasoline station sales.

There are approximately 1050 gasoline station outlets in five nonattainment areas that implement either Stage I and Stage II; and about 250 gasoline station outlets in Platte, Clay, and Jackson counties that implement Stage I.

Sample Calculation (St. Louis County)

To estimate ozone emissions from gasoline marketing in St. Louis County, the total gasoline distributed (TGD) in this inventory region is

TGD = Vehicle Miles Traveled (VMT) X Average Miles per gallon (EF)
= 47,955,115 miles X 16.73 gallons per mile
= 802,958,274.53 gallons.

a. Emissions from Gasoline Trucks in transit assuming that gasoline consumption is proportional to gasoline station sales.

TTE = TGD X LEF X GTA)/ (TGD X UEF X GTA)

Where:

TTE = Total gasoline emissions from tank trucks in transit (tons per year)
LEF = Loaded tank truck in-transit emission factor from Table 11.3.1 (0.055 lb/1000 gal)
UEF = Unloaded tank truck in-transit emission factor from Table 11.3.1 (0.005 lb/1000 gal)
GTA = 1.25, a national default rate as gasoline transportation adjustment factor.
TTE = ((802,958,274.53 X 0.055 X 1.25) + (802,958,274.53 X 0.005 X 1.25))/ (2000 X 1000)
= 30.11 tpy

b. Emissions from Fuel Delivery to Outlets

FDO = (TGD X FDOE)/ (2000 X 1000)

Where:

FDO = Emissions from Fuel Delivery to Outlets in tons per year (tpy)
FDOE = Uncontrolled gasoline emission factor (27 lbs/1000 gals) X Stage 1 control (90 %) which is 27 lbs/1000 gals X 0.1 = 0.3 lbs/1000 gals

FDO = (802,958,274.53 X 0.3) / (2000 X 1000) = 120.44 tpy

c. <u>Emissions from Storage Tank Breathing</u>

STB = (TGD X STBE)/ (2000 X 1000)

Where:

STB = Emissions from Storage Tank Breathing in ton per year (tpy)
STBE = 1.0lb/1000 gallons taken from Table 11.3-1, EIIP Volume III
STB = (802,958,274.53 X 1.0)/ (2000 X 1000)
= 401.48 tpy

2.16.3 Results

The emissions from Gasoline Distribution for the state of Missouri are as follows:

2.16.4 References

2.17 Landfills

2.17.1 Source Description and Emission Control

This section covers the estimation of non-point source landfill emission sources. These are generally old, unpermitted landfills and closed landfills not reporting yearly emissions as point sources. A municipal solid waste landfill (MSW) unit is a discrete area of land or an excavation that receives household waste and other types of wastes such as commercial solid waste, nonhazardous sludge, and industrial solid waste. This emission estimation method presented below is not suitable for treatment, storage and disposal facilities (TSDFs) or open dumps.

Landfills are significant sources of methane (CH4) and carbon dioxide (CO2). In addition to CH4 and CO2 a small amount of nonmethane organic compounds (NMOCs) are produced. NMOCs include reactive volatile organic compound (VOCs) and hazardous air pollutants (HAPs). Unlike other area sources that may be small sources individually but numerous within the inventory area, only a few landfills may be found within a county area. However, each landfill may emit significant amounts of pollutants. Landfills differ from sources typically

categorized as point or major sources in that pollutants are emitted over the area of the landfill, not at a specific point. For those reasons, landfills have been treated as area sources in the past. Recently, air-operating permits have been required for landfills, so that inventory prepares have begun to address them as point sources.

Landfill emissions are collected through either active or passive collection systems. The combustion or purification of the landfill gas can accomplish disposal or treatment of the collected gases.

As mentioned above, this area source category covers emissions from non-point source landfills. Since the method of estimating emissions utilized by this method is based on the average amount of refuse generated per capita, the known gaseous emissions generated by waste disposed of in permitted sanitary landfills must be removed from the totals. This was done by subtracting the reported point source VOC totals for each county from the total estimated by the population method. In certain counties, large regional waste facilities generate VOC emissions which are greater than the area source total. This results in a net negative VOC emissions value for those particular counties. However, negative values cannot be reported on the NIF tables. Only a "zero" value can be reported. To solve this, the negative emissions value was applied to bordering counties in order to balance out the known point-source VOC emissions without creating a negative number for the county in which the point source landfill resides.

2.17.2 Emission Estimation Methodology

Activity Level

The emissions from municipal landfills were calculated by using the population-based waste generation factor. Although landfills can generate emissions for many years, the greatest emissions were assumed to be emitted from waste 25 years old.

Emission Factors

The per capita waste generation factor is from the U.S. EPA Office of Solid Waste and Emergency Response annual publication, Characterization of Municipal Solid Waste in the United States: 1995 Update. The projection data was obtained from the United States Census Bureau.

Assumptions

- Population figures for the inventory year and 24 previous years for a total of 25 years of population data were collected from the U.S. Census Bureau 2000 Census.
- The waste generation factor of 0.69 tons/person/year was multiplied by the population of each year.
- 0.9072 to get megagrams multiplied tons.
- The average annual wastes were calculated and the values were used in the following equation:

$$Q_{CH4} = L_o R (e^{-kc} - e^{-kt})$$

Where:

Q_{CH4} = Methane generation rate at time t, m^3/yr;

L_o = Methane generation potential, m^3 CH4/Mg refuse;

R = Average annual refuse acceptance rate during active life, Mg/yr;

E = Base log, unitless;

k = Methane generation rate constant, yr^{-1};

c = time since landfill closure, years (c=0 for active landfills); and

t = Time since the initial refuse placement, years.

According to EIIP volume III there is a 0.25 seasonal activity factor.

Sample Calculations (Franklin County)

Using the per capita waste generation factor from the U.S. EPA Office of Solid Waste and Emergency Response annual publication, *Characterization of Municipal Solid Waste in the United States: 1995 Update and the* population data obtained from the United States Census Bureau.
The estimated emissions from the Franklin County inventory area can be illustrated, as follows:

Waste Generation Factor: 0.69 tons/person/yr

Franklin's Average Annual Refuse Acceptance Rate during Active Life: 46730 Mg/yr.

Assuming that c = 0, and t = 6

Methane generation rate at time t, m^3/yr:

$$Q_{CH4} = 125*46730*(1 - e^{-0.04*6}) = 1246373$$

Non-methanogenic organic compound emission rate (Q_{NMOC}), m^3/yr

$$Q_{NMOC} = 2*Q_{CH4}*C_{NMOC}/(1*10^6)$$

Where;

C_{NMOC} = Total NMOC concentration in landfill gas, ppmv as hexane = 1170

$Q_{NMOC} = 2*1246373*1170/(1*10^6) = 2917\ m^3/yr$

The mass emission per year of total NMOCs, kg/yr

$M_{NMOC} = Q_{NMOC}*1050.2/(273+T)$

Where;
T = Temperature of landfill gas (^oC)
$M_{NMOC} = 2917*1050.2/(273+25) = 22648$ kg/yr

Franklin's Uncontrolled NMOC emission Reported as HAPs – H_{NMOC}: 1150 lbs./day

VOC Emission Factor = $[M_{NMOC} - H_{NMOC}]/R = [22648 – 1150]/ 46730 = 0.46$

VOC Emissions = R * 0.46/365 = 46730 * 0.46/ 365 = 59 lbs./day

VOC Actual Emissions = VOC Emissions Area Source – VOC Emission Point Source

VOC Actual Emissions = 59 – 20 = 39 lbs./day

2.17.3 Results

The total VOC emissions from area source landfills in the state of Missouri is 455.38 tons/year.

2.18 Liquefied Petroleum Gas (LPG) Combustion

2.18.1 Fuel Description

This source category covers air emissions from liquefied petroleum gas (LPG) combustion in the residential, commercial/institutional, and small industrial sectors for space heating, water

heating, or cooking. This category includes small boilers, furnaces, heaters and other heating units that are not inventoried as point sources. Residential and commercial sectors comprise housing units; wholesale and retail businesses; health institutions; social and educational institutions; and federal, state and local government institutions (e.g., military installations, prisons, office buildings).

LPG consists of propane, propylene, butane, and butylenes; the products used for domestic heating are composed primarily of propane. The largest market for LPG is the domestic/commercial market. There are three grades of LPG available as heating fuels: commercial-grade propane, engine fuel-grade propane, and commercial-grade butane. The second largest use of LPG is by the chemical industry, where it is used as a petrochemical feedstock, and the agriculture industry. Propane is also used as an engine fuel as an alternative to gasoline and as a standby fuel for facilities that have interruptible LPG service contracts.

2.18.2 Emission Estimation Methodology

The combustion processes that use LPG are very similar to those that use natural gas. LPG is considered a "clean" fuel because it does not produce visible emissions. The criteria pollutants emitted, VOC, NOx, CO, SO2, and PM, are produced in small amounts.

Activity

Residential Sources:

The 2000 Census Bureau data contains information on the primary fuel combusted by houses by county. *Census 2000 – American Fact Finder - Summary File 3, Table H40. House Heating Fuel* provides data on the number of occupied housing units in each county using the following categories of fuels: Utility gas (assumed to be natural gas), bottled, tank, or LP gas, electricity, fuel oil, kerosene, etc., coal or coke, wood, solar energy, other fuel, or no fuel used.

The LPG burned at the state level is apportioned to the county level using U.S. Census data on households that use LPG as a primary fuel. The Department of Energy (DOE) Energy Information Administration (EIA) provides state-level fuel consumption for residential, commercial, and industrial sectors. The equation is:

$$\text{County LPG use} = \text{Statewide LPG use} \times \frac{\text{County LPG burning households}}{\text{State LPG burning households}}$$

Commercial/Institutional Sources:

2002 employment data was obtained from the Missouri Economic Research and Information Center (MERIC). Commercial/Institutional and Industrial sector employment was aggregated for Missouri employees working in the NAICS categories as outlined in Section 1.3.1.

The LPG burned at the state level is apportioned to the county level using 2002 MERIC employment data in NAICS categories 11, and 42-92. The equation is:

$$\text{County LPG Use} = \text{Statewide LPG use X } \frac{\text{NAICS 11, 42-92 employees by county}}{\text{NAICS 11, 42-92 employees by state}}$$

Industrial sources:

The LPG burned at the state level is apportioned to the county level using 2002 MERIC employment data in NAICS categories 21-33. The equation is:

$$\text{County LPG use} = \text{Statewide LPG use X } \frac{\text{NAICS 21-33 employees by county}}{\text{NAICS 21-33 employees by state}}$$

LPG Emission Factors

Emission factors for combustion of LPG in commercial boilers are presented in Table 1.5-1 of Section 1.5 of *AP-42* (EPA, 1998a). Because no emission factors were located for the combustion of LPG for residential consumption, emission factors for commercial boilers are used for residential emissions.

Table 2.18-1. LPG Combustion Emission Factors

Point SCC:	n/a	10301002	10201002
Area SCC:	2104007000	2103007000	2102007000
Pollutant	Residential	Commercial	Industrial
	EF (lb/1000 Gallons)	EF (lb/1000 Gallons)	EF (lb/1000 Gallons)
VOC	0.5	0.5	0.5
NOX	14	14	19
CO	1.9	1.9	3.2
SO2	0.016	0.016	0.016
PM10 & 2.5 PRI	7.6	7.6	7.6
PM10 & 2.5 (Filterable)	1.9	1.9	1.9
PM10 & 2.5 (Condensable)	5.7	5.7	5.7

The emission factor for SO2 requires knowledge of the sulfur content of the LPG. The sulfur content of LPG is very low. EPA's SO2 emissions estimate is derived from the sulfur content of the propane fuel. With 90% of LPG comprised of propane, the EPA's propane emissions factor is a reasonable value for LPG emissions rates. The obtained estimates range from approximately 0.0185% sulfur by weight to 0.060125% sulfur by weight. The statistical average or arithmetic mean of these four estimates is 0.0333% sulfur by weight. The wide range of emissions factors for SO2 makes it difficult to determine a representative estimate for the emissions factor and the very small net effect of any energy-efficiency standard argue against making a significant

research effort. Therefore, the AP-42 emission factor used in the example of 0.016 lb of SO2/1000 gallon will be used.

Temporal Adjustments for Ozone

For the 8-hour ozone NAAQS emission inventory, EPA guidance calls for CO, NOx, and VOC emissions to be reported as actual annual and actual summer weekday. Summer weekday emissions are defined as an average day's emissions for a typical summer day during the ozone season, typically defined as the months of June, July, and August. Fossil fuel consumption drops substantially during the summer months when the need for space heating is virtually zero. A seasonal activity factor is therefore needed to reflect the proportion of fuel consumption that takes place in June-August relative to annual consumption and emissions.

The best way to determine the seasonal activity factor is to obtain activity data that are specific for the location and season of interest. The most specific activity data available is Missouri monthly natural gas consumption data for 2002 for the residential, commercial, and industrial sectors obtained from the EIA. This same activity data was used to derive a residential, commercial/institutional, and industrial seasonal activity factor (SAF) for all the area source fossil fuel combustion calculations, which should have very close to the same proportion of fuel consumed in June-August. Monthly natural gas consumption data for 2002 for the residential, commercial, and industrial sectors were obtained from the EIA table, *Natural Gas Production & Use by Missouri*.

Residential:

Average ozone summer day (OSD) emission estimates were calculated using the equation:

$$\text{Ave. emissions per summer day} = \frac{\text{Annual emissions} \times \dfrac{\text{LPG use in June-August}}{\text{LPG use in 2002}}}{(\text{Operating days/season} = 92)}$$

(LPG used in June-August)/(LPG used in 2002) is the Seasonal Activity Factor SAF=0.0655.

The number of activity days per week for residential activities are 7.

Commercial/Institutional:

Average ozone summer day (OSD) emission estimates were calculated using the equation:

$$\text{Ave. emissions per summer day} = \frac{\text{Annual emissions} \times \dfrac{\text{LPG use in June-August}}{\text{LPG use in 2002}}}{(\text{Operating days/season} = 79)}$$

(LPG used in June-August)/(LPG used in 2002) is the Seasonal Activity Factor SAF=0.0950.

The number activity days per week for commercial/industrial activities are considered to be 6, although this would not hold true for hospitals, nursing homes, and most stores would be 7, while most schools would be 5.

Industrial:

Average ozone summer day (OSD) emission estimates were calculated using the equation:

$$\text{Ave. emissions per summer day} = \frac{\text{Annual emissions} \times \dfrac{\text{LPG use in June-August}}{\text{LPG use in 2002}}}{\text{(Operating days/season = 79)}}$$

(LPG used in June-August)/(LPG used in 2002) is the Seasonal Activity Factor SAF=0.2010.

The number of activity days per week for industrial activities are considered to be an average of about 6.

Sample Calculations (Cole County)

Residential LPG:

Annual VOC (tons/year) = (amount of LPG used in Missouri per yr) X ((# houses using LPG in county) / (# houses using LPG in Missouri)) X (VOC emission factor(lb/1000 Gallons)) / (2000 lb/ton)

OSD VOC (lb/day) = Annual VOC (tons/year) X 2000 lb/ton X SAF / (Operating days/season)

Amount of LPG Used in Missouri: 251,412 1000 Gallons

Number of Houses Using LPG in Missouri: 293,603

Number of Houses Using LPG in Cole County: 2,977

VOC Emission Factor: 0.5 lb/1000 Gallons

Residential Seasonal Activity Factor (SAF): = 0.0655

Operating days/season: 92

Annual VOC (tons/year) = 251,412 1000 Gallons/year X 2,977 houses / 293,603 houses X 0.5 lb/1000 Gallons / 2000 lb/ton = 0.64 tons /year

OSD VOC (lb/day) = 0.64 tons /year X 2000 lb/ton X 0.0655 / 92 = 0.91 lb/day

Commercial/Institutional LPG:

Annual VOC (tons/year) = (amount of LPG used in Missouri per yr) X (# employees using LPG in county) / (# employees using LPG in Missouri) X (VOC emission factor(lb/1000 Gallons)) / (2000 lb/ton)

OSD VOC (lb/day) = Annual VOC (tons/year) X 2000 lb/ton X SAF / Operating days/season

Amount of LPG Used in Missouri: 44,318 1000 Gallons

Number of Comm./Inst. Employees in Missouri: 2,063,988

Number of Comm./Inst. Employees in Cole County: 46,695

VOC Emission Factor: 0.5 lb/1000 Gallons

Activity Days Per Week: 6

Active Days During Ozone Season (June-August): 79

Commercial/Industrial Seasonal Activity Factor (SAF): 0.0950

Annual VOC (tons/year) = 44,318 1000 Gallons X (46,695 / 2,063,988) X (0.5 lb/1000 Gallons) / (2000 lb/ton) = 0.25 tons/year

OSD VOC (lb/day) = 0.25 tons/year X 2000 lb/ton X 0.0950 / 79 = 0.60 lb/day

Industrial LPG:

Annual VOC (tons/year) = (amount of LPG used in Missouri per yr) X (# employees using LPG in county) / (# employees using LPG in Missouri) X (VOC emission factor (lb/1000 Gallons)) / (2000 lb/ton)

OSD VOC (lb/day) = Annual VOC (tons/year) X 2000 lb/ton X SAF / Operating days/season

Amount of LPG Used in Missouri: 151,152 1000 Gallons

Number of Employees in Industrial Sector in Missouri: 462,567

Number of Employees in Industrial Sector in Cole County: 5,621

VOC Emission Factor: 0.5 lb/1000 Gallons

Industrial Seasonal Activity Factor (SAF) = 0.2010

Activity Days Per Week: 6

Active Days During Ozone Season (June-August): 79

Annual VOC (tons/year) = 151,152 1000 Gallons X (5,621 / 462,567) X (0.5 lb/1000 Gallons) / (2000 lb/ton) = 0.46 tons/year

OSD VOC (lb/day) = 0.46 tons/year X 2000 lb/ton X 0.2010 / 79 = 2.34 lb/day

2.18.3 Results

The emissions from LPG Combustion for the State of Missouri are as follows:

2002 Emissions from LPG Combustion in Missouri (Tons/Year)

	VOC	NOx	CO	SO2	PM10	PM2.5
Residential	62.8530	1,759.884	238.8414	2.0113	955.3656	955.3656
Commercial	11.08	310.23	42.10	0.35	168.41	168.41
Industrial	37.7879	1,435.94	241.84	1.21	574.38	574.38

2.19 Natural Gas Combustion

2.19.1 Source Description and Emission Control

Natural gas is one of the major combustion fuels used throughout the country. It is used to generate industrial and utility electrical power, produce industrial process steam, for residential and commercial space heating, water heating, and cooking. Natural gas consists of a high percentage of methane (generally above 85 percent) and varying amounts of ethane, propane, butane, and inerts (typically nitrogen, carbon dioxide, and helium). Air pollutants emitted from natural gas-fired combustion (e.g., boilers, furnaces, etc.) include carbon monoxide ($CO2$), nitrogen oxides (NOx), sulfur oxides (SOx), volatile organic compounds (VOCs), and particulate matter ($PM10$ and $PM2.5$). Residential and commercial sectors comprise housing units; wholesale and retail businesses; health institutions; social and educational institutions; and federal, state and local government institutions (e.g., military installations, prisons, office buildings). In addition, the commercial/institutional sector includes agriculture, forestry, and fishing.

2.19.2 Emission Estimation Methodology

Activity

The Department of Energy (DOE) Energy Information Administration (EIA) provides state-level fuel consumption for residential, commercial, and industrial sectors. The *Natural Gas Production & Use by Missouri* table summarizes both monthly and annual natural gas consumption. EIA does not collect the information necessary to separate natural gas combustion into residential and commercial/institutional consumption, but disaggregates the data based on assumptions and statistical methods applicable to the national level that may not be correct for the inventory area.

Residential Sources:

The 2000 Census Bureau data contains information on the primary fuel combusted by houses by county. *Census 2000 – American Fact Finder - Summary File 3, Table H40. House Heating Fuel* provides data on the number of occupied housing units in each county using the following categories of fuels: Utility gas (assumed to be natural gas), bottled, tank, or LP gas, electricity, fuel oil, kerosene, etc., coal or coke, wood, solar energy, other fuel, or no fuel used.

The natural gas burned at the state level is apportioned to the county level using U.S. Census data on households that use natural gas as a primary fuel. The equation is:

$$\text{County Natural Gas use} = \text{Statewide N. Gas use} \times \frac{\text{County N. Gas burning households}}{\text{State N. Gas burning households}}$$

Commercial/Institutional Sources:

2002 employment data was obtained from the Missouri Economic Research and Information Center (MERIC). Commercial/Institutional and Industrial sector employment was aggregated for Missouri employees working in the NAICS categories as outlined in Section 1.3.1.

The natural gas burned at the state level is apportioned to the county level using 2002 MERIC employment data in NAICS categories 11, and 42-92. The equation is:

$$\text{County Natural Gas Use} = \text{Statewide Nat. Gas use} \times \frac{\text{NAICS 11, 42-92 employees by county}}{\text{NAICS 11, 42-92 employees by state}}$$

Industrial sources:

The natural gas burned at the state level is apportioned to the county level using 2002 MERIC employment data in NAICS categories 21-33. The equation is:

$$\text{County Natural Gas use} = \text{Statewide N. Gas use} \times \frac{\text{NAICS 21-33 employees by county}}{\text{NAICS 21-33 employees by state}}$$

Emission Factors

Natural gas combustion emission factors for VOC, NOx, CO, SO2, and PM are shown in Table 2.15-1. These were obtained from AP-42/FIRE where provided. Those emission factors not in AP-42 were determined in discussions with Pechan Associates, who is verifying and consolidating all the CenRAP states 2002 NEI submittals.

Table 2.19-1. Natural Gas Combustion Emission Factors

Point SCC:	n/a	10300603	10200602
Area SCC:	2104006000	2103006000	2102006000
Pollutant	Residential EF (lb/MMCF)	Commercial EF (lb/MMCF)	Industrial EF (lb/MMCF)
CO	40	84	84
NOX	94	100	100
SO2	0.6	0.6	0.6
VOC	5.5	5.5	5.5
PM10 & 2.5 PRI (Total)	7.6	7.6	7.6
PM10 & 2.5 (Filterable)	1.9	1.9	1.9
PM10 & 2.5 (Condensable)	5.7	5.7	5.7

The SO_2 emission factor assumes that the sulfur content of natural gas is 2,000 grains/$10^6 ft^3$. The filterable PM10 and PM2.5 emission factors are identical as all PM (from natural gas combustion) are assumed to be less than 1.0 micrometers in diameter.

Temporal Adjustments for Ozone

For the 8-hour ozone NAAQS emission inventory, EPA guidance calls for CO, NOx, and VOC emissions to be reported as actual annual and actual summer weekday. Summer weekday emissions are defined as an average day's emissions for a typical summer day during the ozone season, typically defined as the months of June, July, and August. Fossil fuel consumption drops

substantially during the summer months when the need for space heating is virtually zero. A seasonal activity factor is therefore needed to reflect the proportion of fuel consumption that takes place in June-August relative to annual consumption and emissions.

The best way to determine the seasonal activity factor is to obtain activity data that are specific for the location and season of interest. The most specific activity data available is Missouri monthly natural gas consumption data for 2002 for the residential, commercial, and industrial sectors obtained from the EIA. This same activity data was used to derive a residential, commercial/institutional, and industrial seasonal activity factor (SAF) for all the area source fossil fuel combustion calculations, which should have very close to the same proportion of fuel consumed in June-August. Monthly natural gas consumption data for 2002 for the residential, commercial, and industrial sectors were obtained from the EIA table, *Natural Gas Production & Use by Missouri*.

<u>Residential</u>:

Average ozone summer day (OSD) emission estimates were calculated using the equation:

$$\text{Ave. emissions per summer day} = \frac{\text{Annual emissions} \times \dfrac{\text{Gas use in June-August}}{\text{Gas use in 2002}}}{(\text{Operating days/season} = 92)}$$

(Gas used in June-August)/(Gas used in 2002) is the Seasonal Activity Factor (SAF)=0.0655.

The number of activity days per week for residential activities are 7.

<u>Commercial/Institutional</u>:

Average ozone summer day (OSD) emission estimates were calculated using the equation:

$$\text{Ave. emissions per summer day} = \frac{\text{Annual emissions} \times \dfrac{\text{Gas use in June-August}}{\text{Gas use in 2002}}}{(\text{Operating days/season} = 79)}$$

(Gas used in June-August)/(Gas used in 2002) is the Seasonal Activity Factor (SAF)=0.0950.

The number activity days per week for commercial/industrial activities are considered to be 6, although this would not hold true for hospitals, nursing homes, and most stores would be 7, while most schools would be 5.

<u>Industrial</u>:

Average ozone summer day (OSD) emission estimates were calculated using the equation:

$$\text{Ave. emissions per} = \text{Annual emissions} \times \frac{\text{Gas use in June-August}}{\text{Gas use in 2002}}$$

summer day (Operating days/season = 79)

(Gas used in June-August)/(Gas used in 2002) is the Seasonal Activity Factor (SAF)=0.2010.

The number of activity days per week for industrial activities are considered to be an average of about 6.

Sample Calculations (Cole County)

Residential Natural Gas:

Annual VOC (tons/year) = (amount of N. Gas used in Missouri per yr) X ((# houses using N. Gas in county) / (# houses using N. Gas in Missouri)) X (VOC emission factor) / 2000 lb/ton

OSD VOC (lb/day) = Annual VOC (tons/year) X 2000 lb/ton X SAF / (Operating days/season)

Amount of N. Gas Used in Missouri: 115,721 MMCF

Amount of N. Gas Used in Missouri in June-Aug.: 7,576 MMCF

Residential Seasonal Activity Factor (SAF): 7,576 / 115,721 = 0.0655

Number of Houses Using N. Gas in Missouri: 1,261,397

Number of Houses Using N. Gas in Cole County: 11,822

VOC Emission Factor: 5.5 lb/MMCF

Operating days/season: 92

Annual VOC (tons/year) = 115,721 MMCF/year X 11,822 houses / 1,261,397 houses X 5.5 lb/MMCF / 2000 lb/ton = 2.98 tons /year

OSD VOC (lb/day) = 2.98 tons /year X 2000 lb/ton X 0.0655 / 92 = 4.25 lb/day

Commercial/Institutional Natural Gas:

Annual VOC (tons/year) = (amount of N. Gas used in Missouri per yr) X (# employees using N. Gas in county) / (# employees using N. Gas in Missouri) X (VOC emission factor(lb/MMCF)) / (2000 lb/ton)

OSD VOC (lb/day) = Annual VOC (tons/year) X 2000 lb/ton X SAF / Operating days/season

Amount of N. Gas Used in Missouri: 64,703 MMCF

Number of Comm./Inst. Employees Using N. Gas in Missouri: 2,063,988

Number of Comm./Inst. Employees Using N. Gas in Cole County: 46,695

VOC Emission Factor: 5.5 lb/MMCF

Activity Days Per Week: 6

Active Days During Ozone Season (June-August): 79

Commercial/Industrial Seasonal Activity Factor (SAF): 0.0950

Annual VOC (tons/year) = 64,703 MMCF X (46,695 / 2,063,988) X (5.5 lb/MMCF) / (2000 lb/ton) = 4.03 tons/year

OSD VOC = 64,703 MMCF X (46,695 / 2,063,988) X (5.5 lb/MMCF) X 0.0950 / 79
= 9.68 lb/day

Industrial Natural Gas:

Annual VOC (tons/year) = (amount of N. Gas used in Missouri per yr) X (# employees using N. Gas in county) / (# employees using N. Gas in Missouri) X (VOC emission factor (lb/MMCF)) / (2000 lb/ton)

OSD VOC (lb/day) = Annual VOC (tons/year) X 2000 lb/ton X SAF / Operating days/season

Amount of N. Gas Used in Missouri: 65,903 MMCF

Number of Employees in Industrial Sector in Missouri: 462,567

Number of Employees in Industrial Sector in Cole County: 5,621

VOC Emission Factor: 5.5 lb/MMCF

Industrial Seasonal Activity Factor (SAF) = 0.2010

Activity Days Per Week: 6

Active Days During Ozone Season (June-August): 79

Annual VOC (tons/year) = 65,903 MMCF X (5,621 / 462,567) X (5.5 lb/MMCF) / (2000 lb/ton) = 2.20 tons/year

OSD VOC (lb/day) = 2.20 tons/year X 2000 lb/ton X 0.2010 / 79 = 11.21 lb/day

2.19.3 Results

The emissions from Natural Gas Combustion for the State of Missouri are as follows:

2002 Emissions from Natural Gas Combustion in Missouri (Tons/Year)

	VOC	NOx	CO	SO2	PM10	PM2.5
Residential	318.23	5438.89	2314.42	34.72	439.74	439.74
Commercial	177.93	3235.15	2717.53	19.41	245.87	245.87
Industrial	181.23	3295.15	2,767.93	19.77	250.43	250.43

2.20 Distillate Fuel Oil and Kerosene Combustion

2.20.1 Source Description and Emission Controls

This emission source covers air emissions from the combustion of distillate fuel oils and kerosene by the residential, commercial/institutional and industrial sectors for space heating, water heating or process heating. This source category includes small boilers, furnaces, heaters, and other heating units that are not inventoried as point sources. Residential and commercial

fuel oil and kerosene combustion sectors include housing units; wholesale and retail businesses; health institutions; social and educational institutions; and federal, state and local government institutions (e.g., military installations, prisons, office buildings).

Two major categories of fuel oil are burned by combustion sources: distillate oils and residual oils. These oils are further distinguished by grade numbers, with Nos. 1 and 2 being distillate oils; Nos. 5 and 6 being residual oils; and No. 4 being either distillate oil or a mixture of distillate and residual oils. No. 6 fuel oil is sometimes referred to as Bunker C. Distillate oils are more volatile and less viscous than residual oils. They have negligible nitrogen and ash contents and usually contain less than 0.3 percent sulfur (by weight). Distillate oils are used mainly in domestic and small commercial applications, and include kerosene and diesel fuels. Being more viscous and less volatile than distillate oils, the heavier residual oils (Nos. 5 and 6) may need to be heated for ease of handling and to facilitate proper atomization. Because residual oils are produced from the residue remaining after the lighter fractions (gasoline, kerosene, and distillate oils) have been removed from the crude oil, they contain significant quantities of ash, nitrogen, and sulfur. Residual oils are used mainly in utility, industrial, and large commercial applications.

2.20.2 Emission Estimation Methodology

Activity

The area source method given in EIIP volume III was used to estimate emissions from residential, commercial/institutional, and industrial distillate fuel oil and kerosene combustion. This method relies on the number of households burning distillate fuel oil and kerosene per county, and county employment figures in the commercial/institutional and industrial sectors. The quantity of distillate fuel oil and kerosene used by the residential, commercial, and industrial sectors in Missouri was obtained from the Energy Information Administration (EIA) at the U.S. Department of Energy.

Residential Sources:

The sum of distillate fuel oil and kerosene burned at the state level is apportioned to the county level using U.S. Census data on households that use fuel oil or kerosene as a primary fuel. The equation is:

$$\text{County Fuel Oil use} = \text{Statewide Fuel Oil use} \times \frac{\text{County Fuel Oil burning households}}{\text{State Fuel Oil burning households}}$$

Commercial/Institutional Sources:

The fuel oil burned at the state level is apportioned to the county level using 2002 MERIC employment data in NAICS categories 11, and 42-92 as outlined in Section 1.3.1. The equation is:

$$\text{County Fuel Oil Use} = \text{Statewide Fuel Oil use} \times \frac{\text{NAICS 11, 42-92 employees by county}}{\text{NAICS 11, 42-92 employees by state}}$$

Industrial Sources:

The fuel oil and kerosene burned at the state level is apportioned to the county level using 2002 MERIC employment data in NAICS categories 21-33. The equation is:

$$\text{County Fuel Oil use} = \text{Statewide Fuel Oil use} \times \frac{\text{NAICS 21-33 employees by county}}{\text{NAICS 21-33 employees by state}}$$

Emission Factors

Fuel oil and kerosene combustion emission factors for VOC, NOx, CO, SO2, and PM are shown in Table 2.18-1. These were obtained from AP-42/FIRE where provided. Those emission factors not in AP-42 were determined in discussions with Pechan Associates, who is verifying and consolidating all the CenRAP states 2002 NEI submittals.

Table 2.20-1. Fuel Oil / Kerosene Combustion Emission Factors

Point SCC:		10300501/02/03	10200501/02/03
Area SCC:	2104004000	2103004000	2102004000
Pollutant	Residential EF (lb/1000 Gallons)	Commercial EF (lb/1000Gallons)	Industrial EF (lb/1000 Gallons)
VOC	0.713	0.34	0.2
NOX	18	20	20
CO	5	5	5
SO2	0.426	0.426	0.426
PM10 PRI (Total)	2.38	2.38	2.3
PM2.5 PRI (Total)	2.13	2.13	1.55
PM10 (Filterable)	1.08	1.08	1
PM2.5 (Filterable)	0.83	0.83	0.25
PM10 & 2.5 (Condensable)	1.3	1.3	1.3

The emission factor for SO2 is 142S where S = sulfur content, said to be less than 0.3% for distillate oils, is assumed to be 0.3% to be conservative.

It was assumed that kerosene emission factors are similar to distillate oil emission factors.

Temporal Adjustments for Ozone

For the 8-hour ozone NAAQS emission inventory, EPA guidance calls for CO, NOx, and VOC emissions to be reported as actual annual and actual summer weekday. Summer weekday emissions are defined as an average day's emissions for a typical summer day during the ozone season, typically defined as the months of June, July, and August. Fossil fuel consumption drops

substantially during the summer months when the need for space heating is virtually zero. A seasonal activity factor is therefore needed to reflect the proportion of fuel consumption that takes place in June-August relative to annual consumption and emissions.

The best way to determine the seasonal activity factor is to obtain activity data that are specific for the location and season of interest. The most specific activity data available is Missouri monthly natural gas consumption data for 2002 for the residential, commercial, and industrial sectors obtained from the EIA and described in the *Natural Gas Combustion Section 2.17.3 Temporal Adjustments*. This same activity data was used to derive a residential, commercial/institutional, and industrial seasonal activity factor (SAF) for all the area source fossil fuel combustion calculations, which should have very close to the same proportion of fuel consumed in June-August,

Sample Calculations (Cole County)

<u>Residential Fuel Oil and Kerosene:</u>

Annual VOC (tons/year) = (amount of fuel oil used in Missouri per yr) X (# houses using fuel oil in county) / (# houses using fuel oil in Missouri) X (VOC emission factor) / (2000 lb/ton)

OSD VOC (lb/day) = Annual VOC (tons/year) X 2000 lb/ton X Seasonal Activity Factor / Active Days per Season

Amount of Fuel Oil Used in Missouri: 15,708 tons

Number of Houses Using Fuel Oil in Missouri: 13,893

Number of Houses Using Fuel Oil in Cole County: 40

VOC Emission Factor: 0.713 lb/ton

Activity Days Per Week: 7

Residential Seasonal Activity Factor (SAF) = 0.0655

Active Days During Ozone Season (June-August): 92

Annual VOC (tons/year) = 15,708 1000 Gallons X (40 houses/ 13,893 houses) X (0.713 lb/1000 Gallons) / 2000 lb/ton = 0.016 tons/year

OSD VOC (lb/day) = 0.016 X 2000 lb/ton X 0.0655 / 92 days = 0.023 lb/day

<u>Commercial / Institutional Fuel Oil and Kerosene:</u>

Annual VOC (tons/year) = (amount of Fuel Oil used in Missouri per yr) X (# Comm./Inst. employees in county) / (# Comm./Inst. employees using Fuel Oil in Missouri) X (VOC emission factor(lb/1000 Gallons)) / (2000 lb/ton)

OSD VOC (lb/day) = Annual VOC (tons/year) X 2000 lb/ton X SAF / Operating days/season

Amount of Fuel Oil Used in Missouri: 44,368 1000 Gallons

Number of Comm./Inst. Employees in Missouri: 2,063,988

Number of Comm./Inst. Employees in Cole County: 46,695

VOC Emission Factor: 0.34 lb/1000 Gallons

Activity Days Per Week: 6

Active Days During Ozone Season (June-August): 79

Commercial/Industrial Seasonal Activity Factor (SAF): 0.0950

Annual VOC (tons/year) = 44,368 1000 Gallons X (46,695 / 2,063,988) X (0.34 lb/1000 Gallons) / (2000 lb/ton) = 0.17 tons/year

OSD VOC (lb/day) = 0.17 tons/year X 2000 lb/ton X 0.0950 / 79 = 0.41 lb/day

<u>Industrial Fuel Oil and Kerosene:</u>

Annual VOC (tons/year) = (amount of Fuel Oil used in Missouri per yr) X (# Industrial employees Cole County) / (# Industrial employees in Missouri) X (VOC emission factor (lb/1000 Gallons)) / (2000 lb/ton)

OSD VOC (lb/day) = Annual VOC (tons/year) X 2000 lb/ton X SAF / Operating days/season

Amount of Fuel Oil Used in Missouri: 145,476 1000 Gallons

Number of Employees in Industrial Sector in Missouri: 462,567

Number of Employees in Industrial Sector in Cole County: 5,621

VOC Emission Factor: 0.2 lb/1000 Gallons

Industrial Seasonal Activity Factor (SAF) = 0.2010

Activity Days Per Week: 6

Active Days During Ozone Season (June-August): 79

Annual VOC (tons/year) = 145,476 1000 Gallons X (5,621 / 462,567) X (0.2 lb/1000 Gallons) / (2000 lb/ton) = 0.177 tons/year

OSD VOC (lb/day) = 0.177 tons/year X 2000 lb/ton X 0.2010 / 79 = 0.90 lb/day

2.20.3 Results

The emissions from Fuel Oil and Kerosene Combustion for the State of Missouri are as follows:

2002 Emissions from Fuel Oil and Kerosene Combustion in Missouri (Tons/Year)

	VOC	NOx	CO	SO2	PM10	PM2.5
Residential	5.5999	141.3720	39.2700	3.3458	18.6925	16.7290
Commercial	7.5425	443.6777	110.9194	9.4503	52.7976	47.2517
Industrial	14.5476	1,454.7625	363.6906	30.9864	167.2977	112.7441

Note how high the SO2 emissions are, based on the average sulfur content of 4% in Missouri coal. However, much of the coal burned in Missouri is from other states such as Wyoming, which is low sulfur coal. The average sulfur content of coal burned in Missouri should therefore be determined with greater accuracy and these emissions revised. Revised emissions should be sent to the EPA in the next round of revisions.

2.21 COAL COMBUSTION

2.21.1 Source Description and Emission Control

Coal is a complex combination of organic matter and inorganic mineral matter formed over eons from successive layers of fallen vegetation. Bituminous coals are by far the largest group and are characterized as having lower fixed carbon and higher volatile matter. This source category

covers air emissions from coal combustion in the residential and commercial sectors for space heating or water heating. This category includes small boilers, furnaces, heaters, and other heating units that are not inventoried as point sources. Residential and commercial coal combustion sectors comprise housing units; wholesale and retail businesses; health institutions; social and educational institutions; and federal, state, and local government institutions. Major emissions from coal combustion are volatile organic compounds (VOC), nitrogen oxides (NOx), carbon monoxide (CO), sulfur oxides (SOx), and particulate matter (PM_{10} and $PM_{2.5}$).

2.21.2 Emission Estimation Methodology

Activity

The area source method given in EIIP volume III was used to estimate emissions from residential, commercial/institutional, and industrial coal combustion. This method relies on the number of households burning coal per county, and county employment figures in the commercial/institutional and industrial sectors. The quantity of coal used by the residential, commercial, and industrial sectors in Missouri was obtained from the Energy Information Administration (EIA) at the U.S. Department of Energy.

Residential Sources:

The coal burned at the state level is apportioned to the county level using U.S. Census data on households that use coal as a primary fuel. The equation is:

$$\text{County coal use} = \text{Statewide coal use} \times \frac{\text{County coal-burning households}}{\text{State coal-burning households}}$$

Commercial/Institutional Sources:

The coal burned at the state level is apportioned to the county level using 2002 MERIC employment data in NAICS categories 11, and 42-92 as outlined in Section 1.3.1. The equation is:

$$\text{County coal Use} = \text{Statewide coal use} \times \frac{\text{NAICS 11, 42-92 employees by county}}{\text{NAICS 11, 42-92 employees by state}}$$

Industrial Sources:

The coal burned at the state level is apportioned to the county level using 2002 MERIC employment data in NAICS categories 21-33. The equation is:

$$\text{County coal use} = \text{Statewide coal use} \times \frac{\text{NAICS 21-33 employees by county}}{\text{NAICS 21-33 employees by state}}$$

Emission Factors

Coal combustion emission factors for VOC, NOx, CO, SO2, and PM are shown in Table 2.15-1. These were obtained from AP-42/FIRE where provided. Those emission factors not in AP-42 were determined in discussions with Pechan Associates, who is verifying and consolidating all the CenRAP states 2002 NEI submittals.

Table 2.21-1. Coal Combustion Emission Factors

Point SCC:	10300214	10300208	10200202
Area SCC:	2104002000	2103002000	2102002000
Pollutant	Residential EF (lb/ton)	Commercial EF (lb/ton)	Industrial EF (lb/ton)
VOC (TNMOC)	10	1.3	0.06
NOX	9.1	9.5	22
CO	275	11	0.5
SO2	124	124	152
PM10 PRI (Total)	7.24	7.24	20.22
PM2.5 PRI (Total)	4.84	4.84	6.62
PM10 (Filterable)	6.2	6.2	18.4
PM2.5 (Filterable)	3.8	3.8	4.8
PM10 & 2.5 (Condensible)	1.04	1.04	1.82

AP-42's emission factor for sulfur is 31 S (S= Sulfur content) = 124 lb/ton (residential and commercial/institutional); and 38 S (S= Sulfur content) = 152 lb/ton (industrial). SO2 Sulfur content in Missouri averages about 4%.
http://www.eia.doe.gov/cneaf/coal/st_coal_pdf/0576q.pdf

8% Ash content is assumed based upon AP-42 and January 2000 *Mercury Speciation Stack Sampling Test Report: Meramec Unit 4* that was conducted for the EPA's Information Collection Request (ICR) to characterize mercury emissions from coal-fired power plants in the United States.

Temporal Adjustments for Ozone

For the 8-hour ozone NAAQS emission inventory, EPA guidance calls for CO, NOx, and VOC emissions to be reported as actual annual and actual summer weekday. Summer weekday emissions are defined as an average day's emissions for a typical summer day during the ozone season, typically defined as the months of June, July, and August. Fossil fuel consumption drops substantially during the summer months when the need for space heating is virtually zero. A seasonal activity factor is therefore needed to reflect the proportion of fuel consumption that takes place in June-August relative to annual consumption and emissions.

The best way to determine the seasonal activity factor is to obtain activity data that are specific for the location and season of interest. The most specific activity data available is Missouri monthly natural gas consumption data for 2002 for the residential, commercial, and industrial

sectors obtained from the EIA and described in the *Natural Gas Combustion Section 2.17.3 Temporal Adjustments*. This same activity data was used to derive a residential, commercial/institutional, and industrial seasonal activity factor (SAF) for all the area source fossil fuel combustion calculations, which should have very close to the same proportion of fuel consumed in June-August.

Sample Calculations – Cole County

Residential Coal:

Annual VOC (tons/year) = (amount of coal used in Missouri per yr) X ((# houses using coal in county) / (# houses using coal in Missouri)) X (VOC emission factor(lb/ton)) / (2000 lb/ton)

OSD VOC (lb) = (amount of coal used in Missouri per yr) X (# houses using coal in county) / (# houses using coal in Missouri) X (VOC emission factor) X Seasonal Activity Factor / Active Days per Season

Amount of Coal Used in Missouri: 19,000 tons

Number of Houses Using Coal in Missouri: 170

Number of Houses Using Coal in Cole County: 0

VOC Emission Factor: 10 lb/ton

Activity Days Per Week: 7

Residential Seasonal Activity Factor (SAF) = 0.0655

Active Days During Ozone Season (June-August): 92

Annual VOC = 19,000 tons X (0 houses/ 170 houses) X (10 lb/ton) / (2000 lb/ton)
= 0 tons/year

OSD VOC = 19,000 tons X (0 houses/ 170 houses) X (10 lb/ton) X 0.0655 (proportion of fuel consumed in June-August) / 92 days = 0 lb/day

Commercial / Institutional Coal:

Annual VOC (tons/year) = (amount of coal used in Missouri per yr) X (# employees using coal in county) / (# employees using coal in Missouri) X (VOC emission factor(lb/ton)) / (2000 lb/ton)

OSD VOC (lb) = (amount of coal used in Missouri per yr) X (# employees using coal in county) / (# employees using coal in Missouri) X (VOC emission factor) X (seasonal activity factor) / (active days during June – August)

Amount of Coal Used in Missouri: 147,794.07

Number of Employees in Commercial/Institutional Sector in Missouri: 2,063,988

Number of Employees in Commercial/Institutional Sector in Cole County: 46,695

VOC Emission Factor: 1.3 lb/ton

Commercial/Institutional Seasonal Activity Factor (SAF) = 0.0950

Activity Days Per Week: 6

Active Days During Ozone Season (June-August): 79

Annual VOC = 147,794.07 tons X (46,695 / 2,063,988) X (1.3 lb/ton) / (2000 lb/ton)
= 2.17 tons/year

OSD VOC = Annual VOC X 2000 lb/ton X (0.0950 (proportion of fuel consumed in June-August)) / 79 days = 5.23 lb/day

<u>Industrial Coal:</u>

Annual VOC (tons/year) = (amount of coal used in Missouri per yr) X (# employees using coal in county) / (# employees using coal in Missouri) X (VOC emission factor(lb/ton)) / (2000 lb/ton)

OSD VOC (lb) = (amount of coal used in Missouri per yr) X (# employees using coal in county) / (# employees using coal in Missouri) X (VOC emission factor) X (seasonal activity factor) / (active days during June – August)

Amount of Coal Used in Missouri: 429,959 tons

Number of Employees in Industrial Sector in Missouri: 462,567

Number of Employees in Industrial Sector in Cole County: 5,621

VOC Emission Factor: 0.06 lb/ton

Industrial Seasonal Activity Factor (SAF) = 0.2010

Activity Days Per Week: 6

Active Days During Ozone Season (June-August): 79

Annual VOC = 429,959 tons X (5,621 / 462,567) X (0.06 lb/ton) / 2000 lb/ton

= 0.16 tons/year

OSD VOC = 429,959 tons X (5,621 / 462,567) X (0.06 lb/ton) / X (0.2010) / 79
= 0.80 lb/day

2.21.3 Results

The emissions from Coal Combustion for the State of Missouri are as follows:

2002 Emissions from Coal Combustion in Missouri (Tons/Year)

	VOC	NOx	CO	SO2	PM10	PM2.5
Residential	95.00	86.45	2,612.5	1,178.0	68.78	45.98
Commercial	96.07	702.02	812.87	9,163.2	535.01	357.66
Industrial	12.90	4,729.55	107.49	32,676.87	4,346.88	1,423.16

Note how high the SO2 emissions are, based on the average sulfur content of 4% in Missouri coal. However, much of the coal burned in Missouri is from other states such as Wyoming, which is low sulfur coal. The average sulfur content of coal burned in Missouri should therefore be determined with greater accuracy and these emissions revised. Revised emissions should be sent to the EPA in the next round of revisions.

Emission factor revisions were discussed at length in e-mail correspondence between Mollie Freebairn, APCP and Randy Strait, Pechan Associates, on 9/13, 9/14, 9/16, 9/17, and 9/18/2004 and are on file at the APCP.

EIA State Coal Profile: Missouri http://www.eia.doe.gov/cneaf/coal/st_coal_pdf/0576q.pdf

2.22 Wood Combustion – Residential

In the 1999 NEI for Missouri, Residential Wood Burning was the second highest area source category for criteria pollutant emissions overall, primarily CO, VOC, and PM10 and PM2.5, second only to unpaved road fugitive dust emissions. Its ranking was similar in other states. These findings have led to a number of studies and surveys around the United States to improve and update activity data and emission factors for residential wood burning. While it was not possible to conduct a statewide survey here in Missouri to determine residential wood burning usage patterns, there is good information available from the Energy Information Administration, 2000 U.S. Census, and other studies referenced below, that was carefully reviewed and incorporated into the somewhat complex method described below.

2.22.1 Source Description and Emission Controls

This area source category of residential wood combustion is defined as wood burning that takes place primarily in woodstoves and fireplaces. Residential wood burning takes place either as a necessary source of heat or for aesthetics. Fireplaces can be divided into 2 broad categories: (1) masonry (generally brick and/or stone, assembled on site, and integral to a structure) and (2) factory-built (usually metal, installed on site as a package with appropriate ductwork). Woodstoves are commonly used in residences as space heaters. They are used both as the primary source of residential heat and to supplement conventional heating systems. There are seven different residential wood combustion source categories:

y **FIREPLACES**
x 2104008001 Without Inserts
x 2104008002 With Inserts; Non-EPA Certified
x 2104008003 With Inserts; Non-Catalytic, EPA Certified
x 2104008004 With Inserts; Catalytic, EPA Certified
y **WOODSTOVES**
x 2104008010 Non-EPA Certified
x 2104008030 Catalytic, EPA Certified
x 2104008050 Non-Catalytic, EPA Certified

Pollutants emitted from residential wood combustion include particulate mater (PM), volatile organic compounds (VOC), nitrogen oxides (NOx), carbon monoxide (CO), and hazardous air pollutants (HAP). Controls for this category may use new technology woodstoves,

improvements in wood burning performance, use of "no burn" periods, public awareness and educational programs, replacement or installation of gas-burning equipment in fireplaces, and total banning of burning.

2.22.2 Emission Estimation Methodology

Activity

The Energy Information Administration (EIA) reports Residential Wood Consumption in Missouri for 1960 to 2000. According to the EIA, in 1987 a total of 907,000 cords was burned in Missouri. The U.S. Forest Service study reports that in 1987, a total of 924,154 cords of wood were produced in Missouri. These figures agree well, since somewhat more wood should have been produced than was consumed.

The EIA estimate for 2000 residential wood consumption in Missouri is 484,000 cords, the latest year for which figures are available. To project an estimate for 2002 residential wood consumption, the EIA data for natural gas consumption in Missouri's residential sector for 2000, 2001, and 2002 are employed. Residential wood consumption was projected by assuming that it was proportional to that of natural gas in Missouri:

Year	Residential Natural Gas (Million Cu. Ft.)	Residential Fuelwood (Cords)
2000	115,353	484,000
2001	116,188	487,504
2002	115,721	485,544

Census 2000 provides a table of number of occupied housing units and house heating fuels for each county in Missouri for 2000. Across Missouri overall about 4% of households used wood, in some counties the average was as high as 34%.

Separate wood consumption estimates for fireplaces with inserts, fireplaces without inserts, non-EPA certified woodstoves, catalytic & noncatalytic EPA-certified woodstoves are made to account for different usage patterns (climate zones; urban vs. rural), and different emission factors, which were obtained from US Census, EIA, and EPA. Primary Wood-Burning Heating Equipment from *American Housing Survey for the United States in 2001* is as follows:

Stoves	1,131,000	84.4%
Fireplaces with inserts	145,000	10.8
Fireplaces without inserts	64,000	4.8
Total	1,340,000	100.0

These proportions were applied to the total number of households burning wood as their main house heating fuel to obtain the number of stoves and fireplaces in each Missouri county. Similar proportions are given in the *EIA 2001 Residential Energy Consumption Survey, Table HC3-1b. Space Heating by Climate Zone, Percent of U.S. Households*, where for Missouri's climate zone, heating stoves comprise 78% of main wood-burning heating equipment and 22% is classified as "other".

92% of the woodstoves are non-EPA certified, 5.7% are EPA certified non-catalytic, and 2.3 percent are EPA-certified catalytic according to *Documentation for Version 2 of the 1999 NEI for Criteria Pollutants- Area Sources*. These figures were used to allocate primary heating with wood to fireplaces and stoves.

The average number of cords burned per main wood-burning unit per year is:

485,544 cords / 77,666 units = 6.25 cords/unit/year

Consulting with people who have used wood as a primary source of fuel, 4 to 6 cords is in fact about what it takes to heat a home for the winter, more for a larger home.

10.1% of all households burn wood as a secondary source of fuel (from Missouri's climate zone in the *EIA 2001 Residential Energy Consumption Survey* cited above.) These households range from those who burn a substantial quantity of wood to those who use it for aesthetic purposes. 10% will be assumed to be the households that burn purely for aesthetic purposes, until more guidance becomes available. The amount burned for aesthetics is estimated over and above that obtained from the EIA, as described in *Documentation for Version 2 of the 1999 NEI for Criteria Pollutants- Area Sources*, cited above: "We have the total cords of wood consumed by the residential section for 1997 from the EIA. This figure does not include consumption for aesthetics…." The average number of cords burned in fireplaces for aesthetic purposes is 0.069 cords/unit/year.

The U.S. Forest Service's 1987 study found that oak and hickory were the principal fuelwood species in Missouri, accounting for 60% and 9% of the total harvested, respectively. Both oak and hickory hardwoods have a density conversion factor of 39.9. One cord of wood is equal to about 79 cubic feet of solid wood.

Emission Factors

Residential wood combustion emission factors are given in *DOCUMENTATION FOR THE FINAL 1999 NATIONAL EMISSIONS INVENTORY (VERSION 3.0) FOR CRITERIA AIR POLLUTANTS AND AMMONIA AREA SOURCES*, Appendix B.

Table B-1. Criteria Pollutant Emission Factors For Residential Wood Combustion, lb/ton

SCC		VOC	NOX	CO	SO2	PM10	PM2.5
2104008001	Fireplaces	229	2.6	64.1	0.4	11.8	11.8
2104008002	Fireplaces: Inserts; non-EPA certified	53	2.8	230.8	0.4	30.6	30.6
2104008003	Fireplaces: Inserts; non-catalytic, EPA certified	12		140.8	0.4	19.6	19.6
2104008004	Fireplaces: Inserts; catalytic, EPA certified	15	2	104.4	0.4	20.4	20.4
2104008010	Woodstoves: General	53	2.8	230.8	0.4	30.6	30.6
2104008030	Catalytic Woodstoves: General	15	2	104.4	0.4	20.4	20.4
2104008050	Non-catalytic Woodstoves: General	12		140.8	0.4	19.6	19.6

Assumptions

It was assumed that there was not significant industrial and commercial wood combustion. The calculations were based strictly on residential consumption data. Temporal adjustments for the ozone season were not made although they perhaps should be since VOC emissions are so high. This would entail a revision to our 2002 NEI submittal to the EPA.

Sample Calculation (Cole County)

SCC - 2104008010 Woodstoves: General - Annual VOC (tons/year) = (number of households in Cole Country heating with wood) X (% of households using woodstoves) X (% of wood stoves that are non-EPA certified) X (average number of cords/household/year) X (volume of a cord of wood) X (density of a cord of wood) / (2000 lb wood/ton) X (VOC emission factor) / (2000 lb emissions/ton)

Number of Houses Burning Wood in Cole County: 335

% of Households Burning Wood that have Woodstoves: 84%

% of Woodstoves that are non-EPA Certified: 92%

Average number of cords/household/year: 6.25

Volume of a cord of wood: 79 cu. ft./cord

Density of a cord of wood: 39.9 lb/cu.ft

VOC Emission Factor: 53 lb/ton

Woodstoves: General - Annual VOC (tons/year) =
335 households X 0.844 X 0.92 X 6.25 cords/household/year X 79 cu. ft./cord X 39.9 lb/cu.ft / 2000 lb/ton X 53 lb VOC/ton / 2000 lb/ton = 68 tons VOC/year

2.22.3 Results

The emissions from Residential Wood Combustion for the State of Missouri are as follows:

2002 Emissions from Residential Wood Combustion in Missouri (Tons/Year)

	VOC	NOx	CO	SO2	PM10	PM2.5
2104008001 Fireplaces	6,938	79	3,884	12	715	715
2104008002 Fireplaces: Inserts; non-EPA certified	2,190	116	9,537	17	1,264	1,264
2104008010 Woodstoves: General	15,746	832	68,570	119	9,091	9,091
2104008030 Catalytic Woodstoves: General	111	15	775	3	152	152

2104008050 Non-catalytic Woodstoves: General	221	0	2,592	7	361	361
2002 EMISSIONS - TOTAL ALL POLLUTANTS – 123,347 TONS	**25,206**	**1,042**	**85,358**	**158**	**11,583**	**11,583**
1999 EMISSIONS – TOTAL ALL POLLUTANTS – 206,454 TONS	**93,211**	**1,058**	**102,817**	**137**	**9,231**	**9,231**

2.23 Traffic Markings

2.23.1 Source Description and Emissions Control

Traffic marking operation consists of marking of highway center, edge stripes, and directional markings and painting on other paved and unpaved surfaces, such as markings in parking lots. Materials used for traffic markings include solvent-based paints, water-bared paints, thermoplastics, preformed tapes, field-reacted materials, and permanent markers. Solvent-based formulations of alkyd resins or chlorinated rubber resins are the most commonly used traffic paints. This inventory report focuses on applications of traffic paints that emit a significant quantity of volatile organic compounds (VOC).

VOC emissions result from the evaporation of organic solvents during and shortly after the application of the marking paint. Three types emit VOC in appreciable amount are: (a) Non-aerosol traffic paint, (b) Aerosol marking paint, and (c) Performed tapes applied to adhesive primer. VOC emissions can also result from cleaning the striping equipment. Because the use of organic solvents in traffic marking is the primary source of emissions, control techniques for this source category involve either product substitution or product reformulation. Alternative formulations include low-solvent-content coatings, water-based coatings, and plastic-based coatings.

2.23.2 Emission Estimation Methodology

Activity Level

The Missouri Department of Transportation (MODOT) keeps records of amount of paint used for traffic coatings in 10 Districts. Since MODOT does not keep records of paint for each county, population figures were used to estimate how much paint was used for each county.

Emission Factor

Based on MODOT information the VOC emission factors for the paint used in 2002 are as follows:

TYPE of Paint	VOC Content (lb/gallon)
White Waterborne	.81
Yellow Waterborne	.81
White Acrylic Copolymer	1.11
Yellow Acrylic Copolymer	1.05
White Epoxy	0
Yellow Epoxy	0

Assumptions

According to a national-level survey of traffic coating end users, it was assumed that 5% of traffic coatings in Missouri was done by agencies other than the Department of Transportation.

Sample Calculation (Cole County)

VOC Emissions (tons/year) = (Population Cole County/Population of District 5) X(VOC emissions for District 5) / 2000 lb/ton

VOC Emissions for District 5 (lb)= Amount of Paint Used (gallons) X VOC Content of Paint (lb/gal) X 1.05 (to account for 5% paint used by other agencies)

Population of Cole County: 71894

Population of District 5: 461578

Gallons of White Waterborne Paint Used in District 5: 37931 gal.

Gallons of Yellow Waterborne Paint Used in District 5: 69653 gal.

Gallons of White Acrylic Copolymer Paint Used in District 5: 102 gal.

Gallons of Yellow Acrylic Copolymer Paint Used in District 5: 106 gal.

Gallons of White Epoxy Paint Used in District 5: 0 gal.

Gallons of Yellow Epoxy Paint Used in District 5: 0 gal.

Activity Days Per Week: 5

VOC Emissions (ton/year) = (71894/461578) X [(37931 X .81) + (69653 X .81) + (102 X 1.11) + (106 X 1.05) + (0 X 0) + (0 X 0)] X 1.05 / 2000 (lb/ton) = 7.144 ton/year

2.23.3 Results

Total VOC emissions from traffic marking for the State of Missouri is 465.7 tons/year.

2.24 Commercial Marine Vessels

2.24.1 Source Description and Emission Control

Emissions from commercial marine vessels were calculated based on the tonnage of cargo moved by ships along the Missouri and Mississippi Rivers through the port of Fort Benton (Kansas City area) and the port of Metropolitan St. Louis in Missouri. This tonnage was taken from the "Waterborne Commerce of the United States - Part 2, Waterways & Harbors, Gulf Coast, Mississippi River System and Antilles" pages 17 & 38 (1).

2.24.2 Emission Estimation Methodology

Activity Level

The most recent figures for tonnage totals are from the year 2001. For the purposes of this report it was assumed that the tonnage for inventory year 2002 would be the same.

The equations used in the calculations were taken from Commercial Marine Emissions Inventory for EPA Category 2 and 3 Compression Ignition Marine Engines in the United States Continental and Inland Waterways (2). The equations are summarized below.

First, annual cargo movement in ton-miles was calculated by multiplying the number of tons shipped in 2001 along the Mississippi River and Missouri River through ports of Fort Benton and St. Louis City, Missouri, by the length of the portion of the Mississippi River and Missouri Rivers running through each individual county.

$$C = L \times T$$

Where:

C = Annual cargo movement (ton-miles)
L = Length of Mississippi & Missouri rivers through each county (miles)
T = Total amount of cargo shipped through each county (short tons)

Emissions per ton-mile were calculated by dividing the product of the deadweight tonnage, cargo capacity factor, and average vehicle speed. Deadweight tonnage is a measurement of the total contents of a ship, including cargo, fuel, crew, passengers, food, and water aside from boiler water. The cargo capacity factor is applied as a correction because ships do not typically operate fully loaded with cargo.

$$E_{TM} = E_{\mathbf{d}} \div (DWT \times CCF \times V \times 24)$$

Where:

E_{TM} = Emissions per ton-mile (lbs/ton-mile)
E_d = Emissions per day per ship from Method A (lbs/day/ship)
DWT = Average dead weight tonnage per ship (tons/ship)
CCF = Cargo capacity factor
V = Average speed of vessel across duty cycle adjusted for max. BHP (miles/hour)
24 = Hours per day to convert ship speed to ship miles per day

Emissions per year were calculated by multiplying the results from the previous equations.

$$E_Y = E_{TM} \times C$$

Where:

E_Y = Emissions per year (lb/year)
E_{TM} = Emissions per ton-mile (lbs/ton-mile)
C = Annual cargo movement (ton-miles)

The total tonnage of cargo shipped along the Mississippi River through the port of St. Louis City, Missouri, in 2001 was **34,432,000** tons. The total tonnage of cargo shipped along the Missouri River through the port of Fort Benton was **9,295,000** tons. As previously mentioned, it was assumed that the tonnages for the year 2002 would be the same. This data was obtained from the U.S. Army Corps of Engineers Waterborne Commerce Statistics Center (1).

Emission Factors

From reference 1, the following values were obtained:

Emission Factors
Avg NOx emissions per day per ship on inland rivers: 641.92 lbs per day-cargo-ship
Avg VOC , 21.70 lbs per day-cargo-ship
Cargo capacity of ships on inland rivers: 0.6
Avg deadweight tonnage per ship: 15,454 short tons
Avg speed of vessels on inland rivers: 8.18 mph

Assumptions

Emissions were apportioned to the county level based on the percent of the Mississippi River and Missouri River flowing adjacent to/through each county. It was assumed that 50% of emissions from Mississippi River would be accounted for in Illinois' inventory and the other 50% of emissions would go to Missouri's inventory (the same holds true for Platte County, whereas 50% of emissions are assumed to be accounted for in Kansas). Using the USGS National Map Viewer, the length of the Missouri & Mississippi Rivers running through the entire state was measured and recorded along with the individual lengths within each county. Maps of each county river length are attached to this report.

There is no reference that asserts the seasonal or temporal variation for this activity. Therefore, it was assumed that activity does not vary throughout the year and occurs seven days per week.

Sample Calculation (Jefferson County)

2002 NOx Emissions from Commercial Marine Vessels in Jefferson County

Cargo movement in 2002 = (Length of river through Jefferson County) x (Total tons shipped through Port of St. Louis in 2001)
= (**21.32** miles) x (**34,432,000** tons)
= **734,090,240** ton-miles

Emissions per ton-mile = (Emissions/day-ship)/[(Avg. deadweight tonnage) x (cargo capacity factor) x (Avg. speed)]
= (**641.92** lbs/NOx/day-ship) / [(**15,454** tons/ship) x (**0.6**) x (**8.18** miles/hr) x (24 hrs/1 day)]
= **3.53×10^{-4}** lbs NOx/ton-mile

2002 annual emissions for both sides of the Mississippi River running through Jefferson County
= (Ton-miles per year) x (Emissions per ton-mile)
= (**734,090,240** ton-miles) x (**3.53×10^{-4}** lbs/ton-mile) x (1 ton/2,000 lbs)
= **129.43** tons NOx/yr

2002 Jefferson Co. emissions = (total Mississippi River emissions) x (Percent of emissions occurring on Missouri side)
= **129.43** tons NOx/yr) x 0.50
= **64.72** tons NOx/yr

2.24.3 Results

The emissions for the State of Missouri from Commercial Marine Vessels are 74.6 ton/year VOC, 1979.2 tons/year NOx, and 184.48 tons/year PM10.

EXECUTIVE SUMMARY

The Central States Regional Air Planning Association (CENRAP) is researching visibility-related issues for its region and is developing a regional haze plan in response to the U.S. Environmental Protection Agency's (EPA) mandate to protect visibility in Class I areas. Agricultural and prescribed burning activities ("planned burning") contribute to episodes of impaired visibility in the CENRAP region-phenomena that the CENRAP seeks to better understand. Therefore, support of the CENRAP's need to develop a regional haze plan, Sonoma Technology, Inc. (STI) developed planned burning emission inventories for the region.

As detailed in the Methods Document, presented in Appendix A, Emission Estimation Methods for the CENRAP Planned Burning Emission Inventories (Methods Document), emissions estimates were prepared for prescribed and agricultural burning activities on federal, state, tribal, and private lands in the CENRAP region. These "bottom up" estimates were prepared by using the First-Order Fire Effects Model (FOFEM), emission factors and fuel loadings gathered from published literature, geographic information systems (GIS) databases of land cover and vegetation, and activity data gathered through telephone surveys.

Year-2002 $PM_{2.5}$ emissions of particulate matter of less than 2.5 µm aerodynamic diameter ($PM_{2.5}$) from planned burning activities in the CENRAP states were estimated to be 317,000 tons (see **Figure ES-1**)—almost 300% higher than the estimate of 110,000 tons of $PM_{2.5}$ prepared by the EPA for the 1999 National Emission Inventory (NEI). In addition, planned burning activities emitted precursors to chemically formed $PM_{2.5}$, including approximately 239,000 tons per year volatile organic compounds (VOC), 80,000 tons per year nitrogen oxides (NO_x), 47,000 tons per year ammonia (NH_3), and 35,000 tons per year sulfur oxides (SO_x). The most significant source of these emissions was the burning of private rangelands, which accounted for 50% of the annual planned burning $PM_{2.5}$ emissions in the CENRAP region. This source category was especially significant in the states of Texas, Oklahoma, and Kansas. Prescribed burning on publicly managed forest and grasslands was the second most significant source of planned burning emissions in the region, accounting for 32% of the annual planned burning $PM_{2.5}$ emissions (see **Figure ES-2**). This source category was especially important in the states of Arkansas, Louisiana, and Minnesota. (Emission estimates by source category and state are tabulated in Appendix B.)

Planned burning emissions peak in the spring. More than 25% of annual activity occurs during the month of March. A smaller peak in emissions occurs during the months of September and October (see **Figure ES-3**). Spring and fall provide the most advantageous climatological and biological conditions for prescribed burning, while agricultural burns tend to occur before spring planting or after fall harvesting.

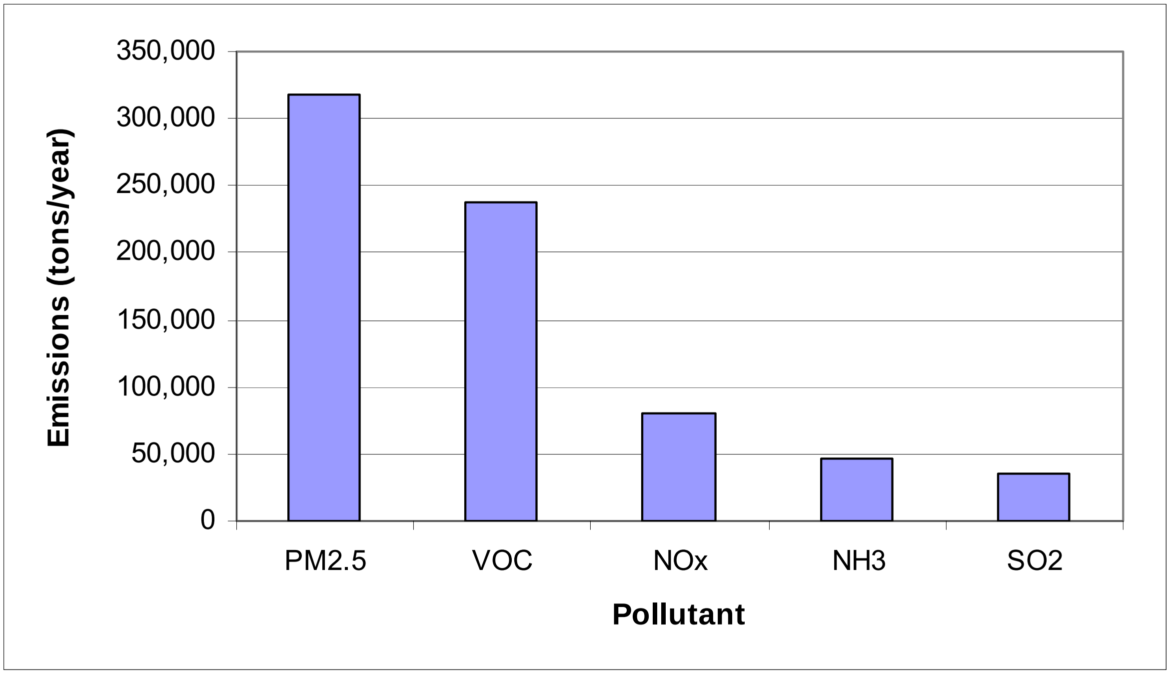

Figure ES-1. CENRAP annual planned burning emissions by pollutant.

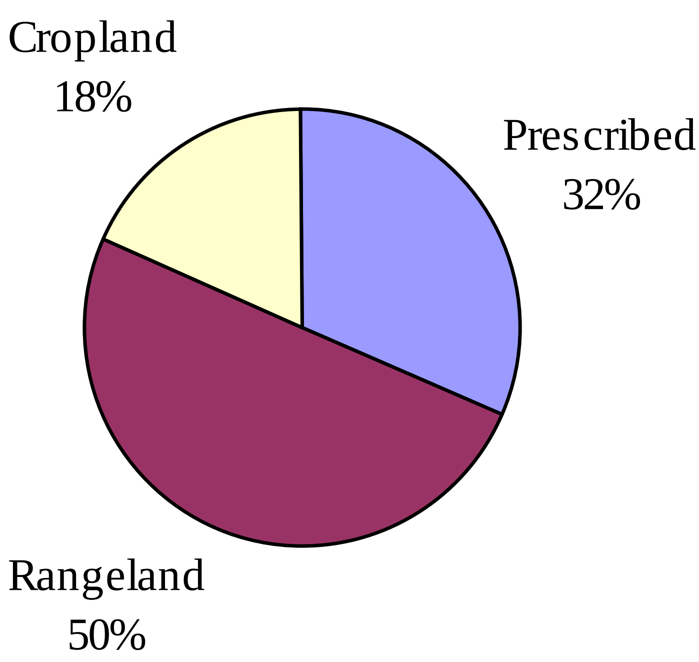

Figure ES-2. CENRAP annual planned burning $PM_{2.5}$ emissions by source category.

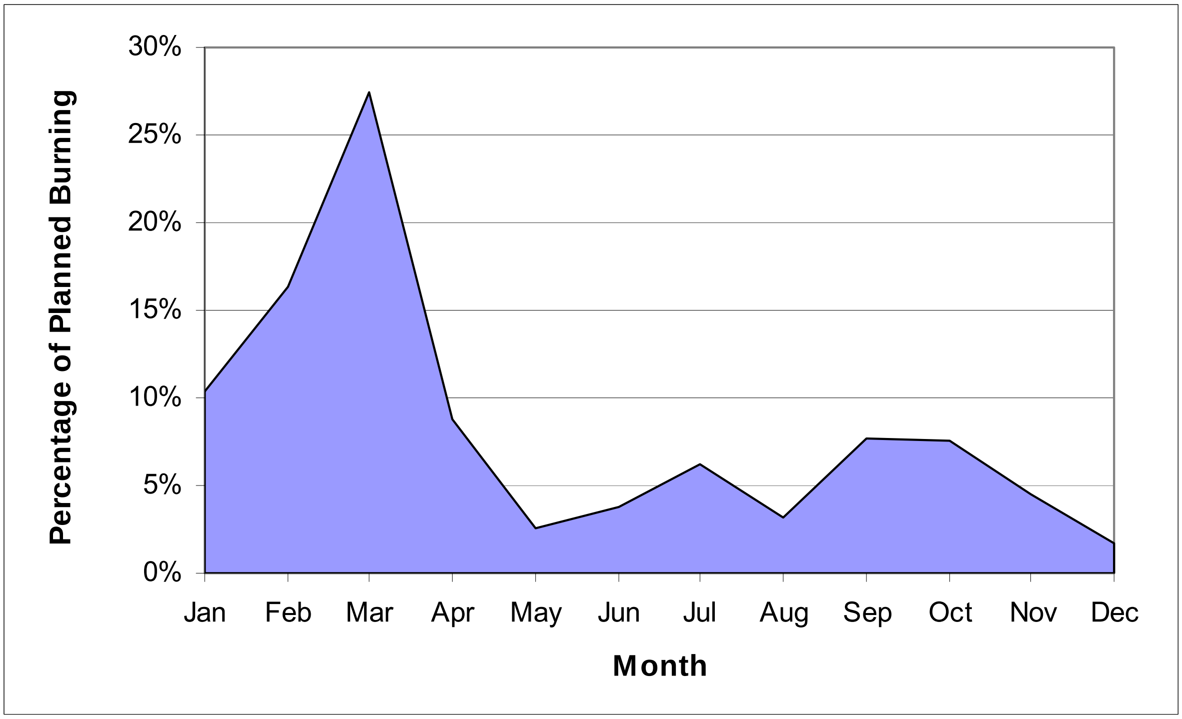

Figure ES-3. Monthly variability in total emissions for the CENRAP region.

The planned burning emission inventory and speciated $PM_{2.5}$ data from the Interagency Monitoring of Protected Visual Environments (IMPROVE) network stations located in Class I areas in the CENRAP region were used to investigate the influence of smoke on ambient $PM_{2.5}$ concentrations and whether individual burns can be detected in the air quality data of Class I areas. The emission inventory and IMPROVE data were utilized to better understand the extent to which prescribed burning affects visibility in the CENRAP region. This preliminary analysis showed that, while influence from specific burns could be seen in the monitoring data on select days when the meteorology was conducive, ammonium sulfate (a species that does not result from burning) was the dominant constituent of the $PM_{2.5}$ mass and visibility reduction, particularly on the 20% worst visibility days of the year, for the sites analyzed.

1. INTRODUCTION

The Central States Regional Air Planning Association (CENRAP) is researching visibility-related issues for its region, which includes the states of Texas, Oklahoma, Louisiana, Arkansas, Kansas, Missouri, Nebraska, Iowa, and Minnesota, and is developing a regional haze plan in response to the U.S. Environmental Protection Agency's (EPA) mandate to protect visibility in Class I areas.[1] In order to develop an effective regional haze plan, the CENRAP ultimately must develop a conceptual model of the phenomena that lead to episodes of low visibility in the CENRAP region. Episodic combustion events (such as agricultural burning, prescribed burning, open burning of wastes, structural fires, and wildfires) sometimes contribute to regional or local haze events in the CENRAP region. Therefore, it is important to develop the emissions data necessary to assess the impacts of these events on visibility in the CENRAP region.

In support of the CENRAP's need to develop a regional haze plan, Sonoma Technology, Inc. (STI) conducted CENRAP Work Assignment Number 02-0214-RP-003-002 "Research and Development of Emission Inventories for Planned Burning Activities for the Central States Regional Air Planning Association". Consistent with the project goals presented in the Work Plan (Coe, 2003b), emissions were calculated for agricultural and prescribed burning on federal, state, tribal, and private lands.

1.1 BACKGROUND AND KEY ISSUES

1.1.1 Fine Particulate Matter Concentrations and Impaired Visibility in Class I Areas

Regional haze is visibility impairment caused mainly by particles of less than 2.5 microns in diameter ($PM_{2.5}$). $PM_{2.5}$ may be directly emitted from emissions sources, such as sources of fugitive dust and combustion soot, which are termed sources of "primary $PM_{2.5}$". Additional mechanisms also occur allowing $PM_{2.5}$ to be formed in the atmosphere, and this phenomenon is termed "secondary formation". Examples include condensable organic aerosols which can form from air emissions of semi-volatile and heavy organic compounds and $PM_{2.5}$ that can form from photochemical reactions of gaseous precursors, including sulfur oxides (SO_x), nitrogen oxides (NO_x), volatile organic compounds (VOC), and ammonia (NH_3).

Analyses of speciated $PM_{2.5}$ samples provide an understanding of the types of emission sources that contribute to regional haze issues in different areas, as depicted in **Figure 1-1**. In urban and ammonia-depleted areas of the eastern United States, secondary sulfate contributes a more significant amount of $PM_{2.5}$ than it does in the western United States. Conversely, secondary nitrate is more important in urban and ammonia-rich areas of the western United States than it is in eastern areas. In both the eastern and western United States, the carbonaceous fraction of $PM_{2.5}$ is significant in urban areas. In rural areas, geologic dust can also be an important contributor to $PM_{2.5}$.

[1] Class I lands include areas such as national parks, wilderness areas, and national monuments. These areas have been granted special air quality protections under the Federal Clean Air Act.

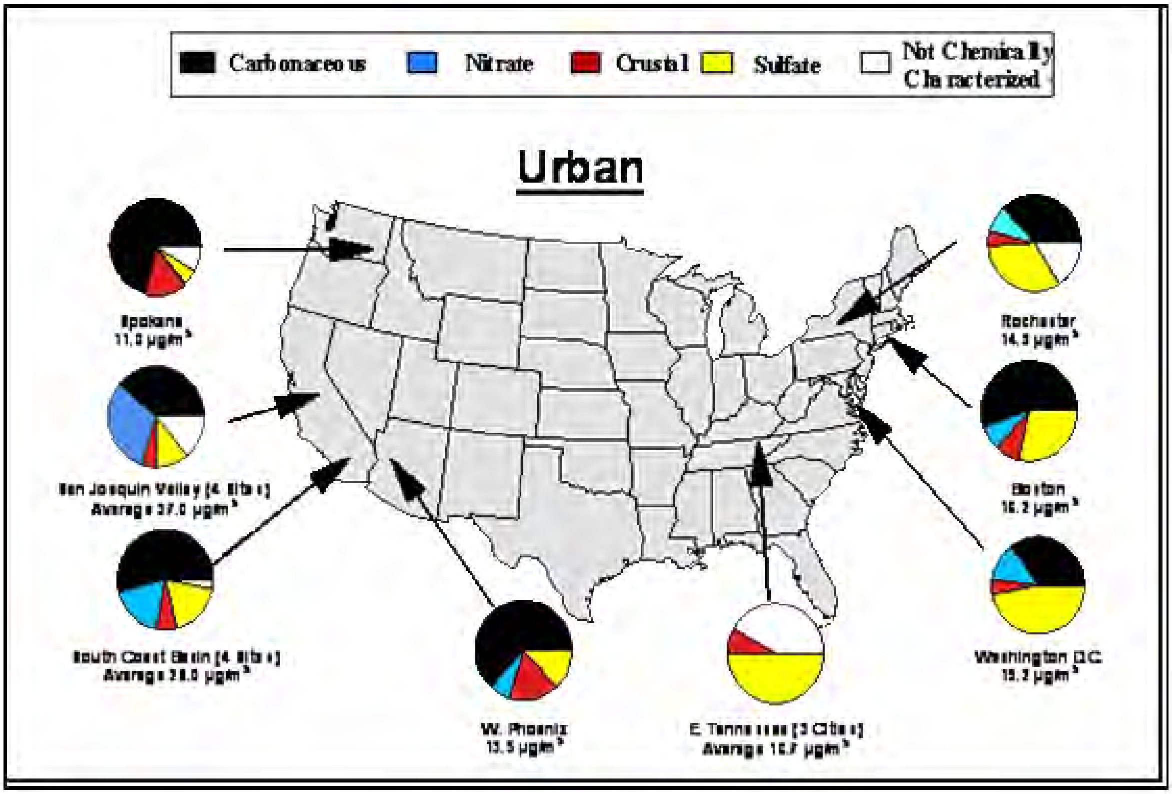

Figure 1-1. Compositions of annual average concentrations of $PM_{2.5}$ observations in urban locations (U.S. Environmental Protection Agency, 1998).

Of particular interest in the CENRAP region is the contribution of $PM_{2.5}$ from wood and grassland burning to visibility impairment in Class I areas. Smoke from these fires emit organic carbon (OC) and elemental carbon (EC); the latter is sometimes referred to as soot or black carbon (BC). OC comes from many sources, both combustion and evaporative, while EC only originates from combustion sources, such as fossil fuel combustion (power plants, car exhaust, etc.) or woodland or grassland burning. Potassium (K) is also emitted during burning of natural materials and can be used as a marker for woodland or grassland burning.

1.1.2 Status of Existing Planned Burning Inventories

Historically, few areas of the CENRAP region have experienced significant air quality problems and, therefore, have not been required to perform air quality monitoring or develop emission inventories. The most comprehensive source of emissions estimates currently available for the region is the EPA's National Emissions Inventory (NEI), which is used as the basis of the EPA's National Emission Trends (NET) document series and analyses. On a state level, emission inventories of burning activities have been prepared by Dennis et al. (2002) for Texas. In the NEI, estimates of $PM_{2.5}$ emissions from planned burning activities in the CENRAP region amount to 110,000 tons per year, or about 9% of the total $PM_{2.5}$ inventory for the region (see **Table 1-1**). The NEI indicates that planned burning emissions are particularly significant in the states of Louisiana and Texas.

Table 1-1. 1999 NEI estimates of $PM_{2.5}$ emissions in the CENRAP region.

State	$PM_{2.5}$ (tons)		Percent
	All Sources	Planned Burning	
Arkansas	91,294	6,735	7.4%
Iowa	108,641	402	0.4%
Kansas	158,521	9,502	6.0%
Louisiana	94,522	34,099	36.1%
Minnesota	163,542	2,874	1.8%
Missouri	183,245	1,147	0.6%
Nebraska	131,486	2,576	2.0%
Oklahoma	149,015	7,137	4.8%
Texas	223,427	45,748	20.5%
Total	1,303,694	110,220	8.5%

As part of its research into regional haze, CENRAP has decided to conduct comprehensive air quality modeling of visibility in 2002. To support this modeling, a bottom-up planned burning emission inventory, which incorporated year-2002-specific fire history data and addressed the uncertainties of the NEI (see below) is required.

Some uncertainties are inherent to the NEI:

- Prescribed burning activities fluctuate dramatically from year to year. Fluctuations are due to policy decisions about the need for wildfire risk management, current climate conditions (drought versus wet conditions), and densities of undergrowth and fuel. Because of these wide fluctuations, emission inventories of prescribed burning are nearly impossible to predict or project on the basis of historical inventories or trends.
- The NEI is estimated on an annual average basis. Regional haze has a seasonal character and is partly driven by photochemical processes. Adjustments are necessary to develop seasonal, diurnal, and, possibly, day-of-week emission estimates.

To support modeling sensitivity runs, measures of uncertainty for all emission estimates are highly valuable for policy decisions and prioritization of future research efforts. To the extent possible, we provide estimates of uncertainty for emissions associated with planned burning activity data that were gathered for this project.

1.2 CURRENT STATUS OF THE CENRAP EMISSION INVENTORY

As detailed in the attached Methods Document (Appendix A), emissions estimates were prepared for prescribed and agricultural burning activities on federal, state, tribal, and private lands in the CENRAP region. These “bottom up” estimates were prepared by using the First-Order Fire Effects Model (FOFEM), emission factors and fuel loadings gathered from published literature, geographic information systems (GIS) databases of land cover and vegetation, and activity data gathered through telephone surveys.

The FOFEM model, a computing tool developed through the Joint Fire Science Program (JFSP), was used to generate estimates of fuel loadings and emission rates for prescribed burns. FOFEM was run for local vegetation types using fuel moisture inputs from the Weather Information Management System (WIMS), a database of daily weather observations gathered from about 1500 fire weather stations throughout the United States. Outputs from FOFEM were then used in conjunction with prescribed burning history information to calculate emissions.

For agricultural burning, emission factors and fuel-loading factors for a variety of crop types are available in the EPA's guidance document, "Compilation of Air Pollutant Emission Factors (AP-42)" (U.S. Environmental Protection Agency, 2003) and from Jenkins et al. (1996). From these sources, we identified fuel loading factors and emission factors for a wide variety crop types and applied these factors to county-specific agricultural burning activity data to generate emissions estimates. The activity data were obtained through systematic telephone surveys of county agricultural extension services (AES).

For both prescribed and agricultural burning activities, the EPA's Biogenic Emissions Landcover Database (BELD) Version 3 (U.S. Environmental Protection Agency, 2001) was used to generate spatial distributions of vegetation types, which in turn were used to select vegetation-specific fuel loading factors output by FOFEM. To do this, cross-walks were established to link the vegetation types in the BELD database with (a) vegetation types in FOFEM and (b) crop types for which emissions factors and fuel loadings are available.

Once a map of vegetation and crop types was developed, we overlaid histories of planned fires, identified the vegetation types associated with each fire occurrence, and applied emission factors generated through FOFEM or acquired from literature to produce county-level emission inventories of agricultural and prescribed burning.

The resulting emission inventory is illustrated in **Figures 1-2 and 1-3** and tabulated in Appendix B. In all cases, we applied generally accepted emission factors and the most complete and up-to-date activity data sets that could be identified and acquired. However, we acknowledge that available emission factors are uncertain and they continue to be the subject of research.

The emission source type in the inventory that we qualitatively consider to contribute the greatest degrees of uncertainty to the total estimated emissions is prescribed burning on privately-held lands performed by the forestry industry. Since new information will be needed to reduce uncertainties in the future, we have provided the CENRAP with an inventory and system of data files that can be updated with revised emission factors and activity data as new information becomes available (see Appendix D).

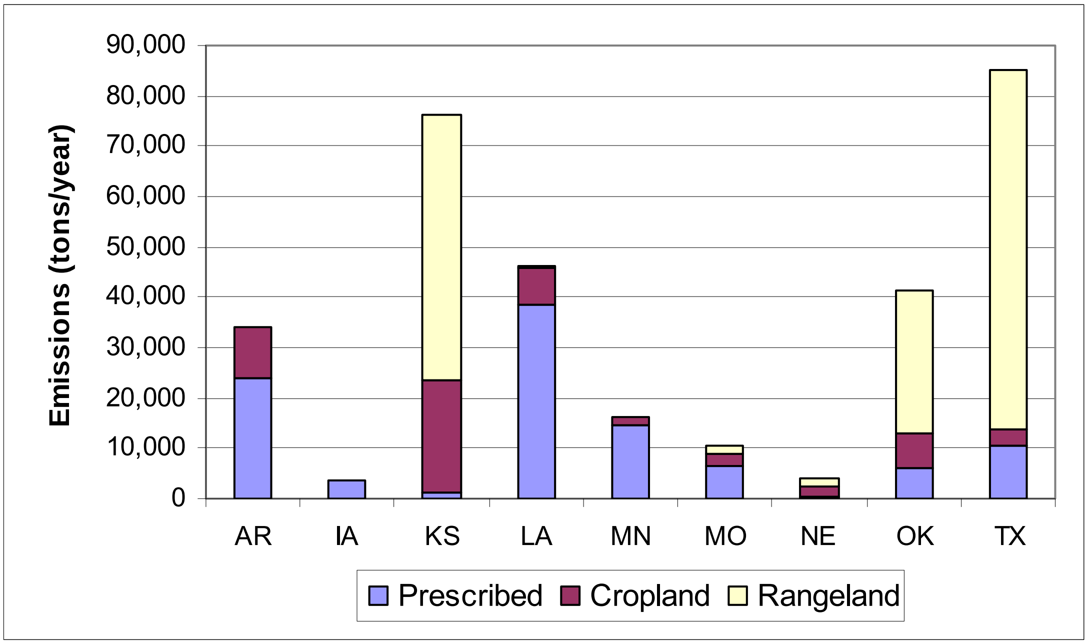

Figure 1-2. Total annual $PM_{2.5}$ emissions by type of planned burning for each state in the CENRAP region.

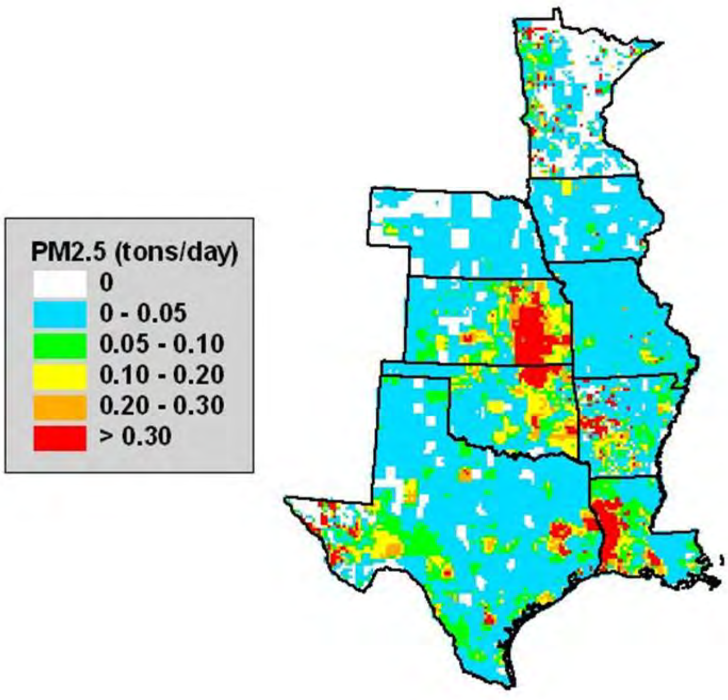

Figure 1-3. Example map of daily emission densities for the CENRAP region (for April 10, 2002).

2. SUMMARY AND ASSESSMENT OF THE INVENTORY

STI calculated emissions as detailed in Appendix A, Emission Estimation Methods for the CENRAP Planned Burning Emission Inventories, with results tabulated in Appendix B, Tabulation of Planned Burning Emissions Estimates for the CENRAP Region. In addition, STI carried out quality assurance procedures as provided in the Quality Assurance Plan and as detailed in this section. In summary, the most important source categories are estimated to be rangeland burning and prescribed burning on publicly managed lands. Total emissions vary seasonally by a factor of three, with peaks occurring in the spring and fall. Prescribed burning performed on privately held lands by the forestry industry is considered to be the greatest source of uncertainty in the overall inventory.

2.1 EMISSIONS FROM PRESCRIBED BURNING

2.1.1 Summary of Emissions from Prescribed Burning

Emission estimates were generated for prescribed burning activities on federal, state, tribal, and private lands. Over one million acres were burned in prescribed fires in 2002 in the CENRAP region, with consequent $PM_{2.5}$ emissions of over 100,000 tons and emissions of precursors as shown in **Table 2-1** and **Figure 2-1**.

Table 2-1. 2002 acres burned and emissions (tons) for prescribed burning in CENRAP states.

STATE	Acres Burned	PM_{10}	$PM_{2.5}$	CO	NO_x	SO_2	NH_3	VOC
Arkansas	244,146	28,130	23,838	302,219	1,961	1,577	2,910	17,444
Iowa	21,449	4,072	3,457	44,542	166	195	257	2,547
Kansas	38,106	1,450	1,226	14,424	228	114	143	881
Louisiana	350,353	45,288	38,376	486,668	3,125	2,531	4,671	28,060
Minnesota	86,642	17,222	14,609	187,853	742	836	1,150	10,740
Missouri	64,781	7,460	6,338	80,019	536	417	756	4,633
Nebraska	6,127	410	347	4,316	36	24	27	254
Oklahoma	104,749	7,322	6,196	76,615	750	479	769	4,507
Texas	137,310	12,669	10,732	134,423	1,071	757	1,427	7,824
Total	1,053,663	124,023	105,119	1,331,080	8,615	6,929	12,111	76,889

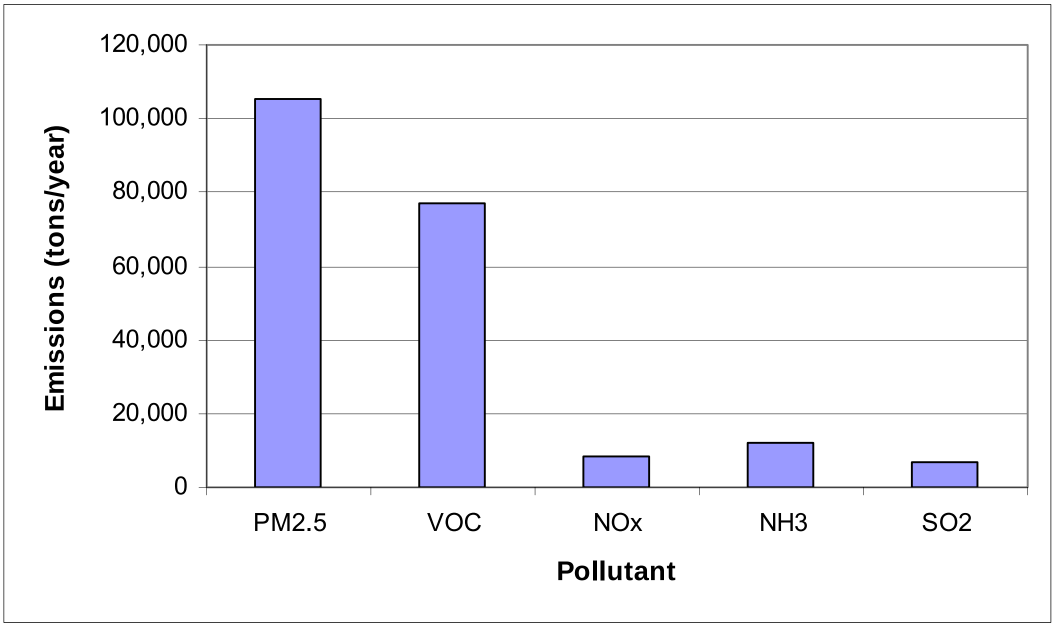

Figure 2-1. Annual prescribed burning emissions by pollutant.

Whenever possible, the exact location, start date, duration of burn, and size of burn incidents were acquired so that emissions from these incidents could be allocated spatially and temporally. The areas and locations of prescribed burn incidents were assigned to their individual centroids.[2] Prescribed burn activities that were reported as incidents (with date, duration, and area) were treated as point sources. Approximately 40% of the prescribed burning inventory was allocated spatially and temporally as point sources. Emissions from the remaining prescribed burning activities were treated as area sources. States that were able to provide "incident-level" databases of prescribed burn activity included Arkansas, Minnesota, and eastern Oklahoma.

The level of prescribed burning activities varied from state to state, as illustrated in **Figures 2-2 and 2-3**. Land managers in Arkansas and Louisiana conducted the most planned burning, and land managers in Minnesota and Texas were the second most active; only limited prescribed burning activity occurred in the states of Iowa, Kansas, and Nebraska.

The seasonal variability of prescribed burning emissions follows a bimodal pattern, with a large peak in spring and a smaller peak in fall. Factors that influence the seasonal variability of burning include weather conditions, fuel moisture content, and the intended environmental consequences of the burn (Dixon et al., 1989). Analysis of fire history records showed that all CENRAP states except Minnesota followed a similar seasonal pattern for prescribed burning. The longer winters in Minnesota delay the spring peak from March to May, while fall-season prescribed burns in Minnesota occur primarily in September rather than being spread evenly over the later summer and fall months as they are in the other states (see **Figure 2-4**).

---

[2] Use of centroids to allocate burns was considered acceptable because the burn areas are typically much smaller in size than the grid resolution of the CENRAP's modeling grid.

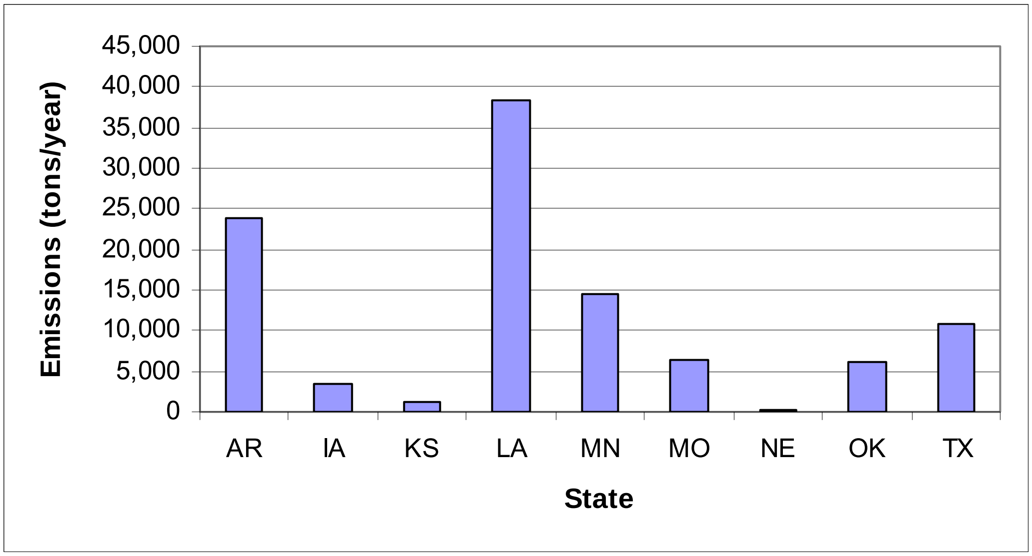

Figure 2-2. Annual prescribed burning $PM_{2.5}$ emissions by state.

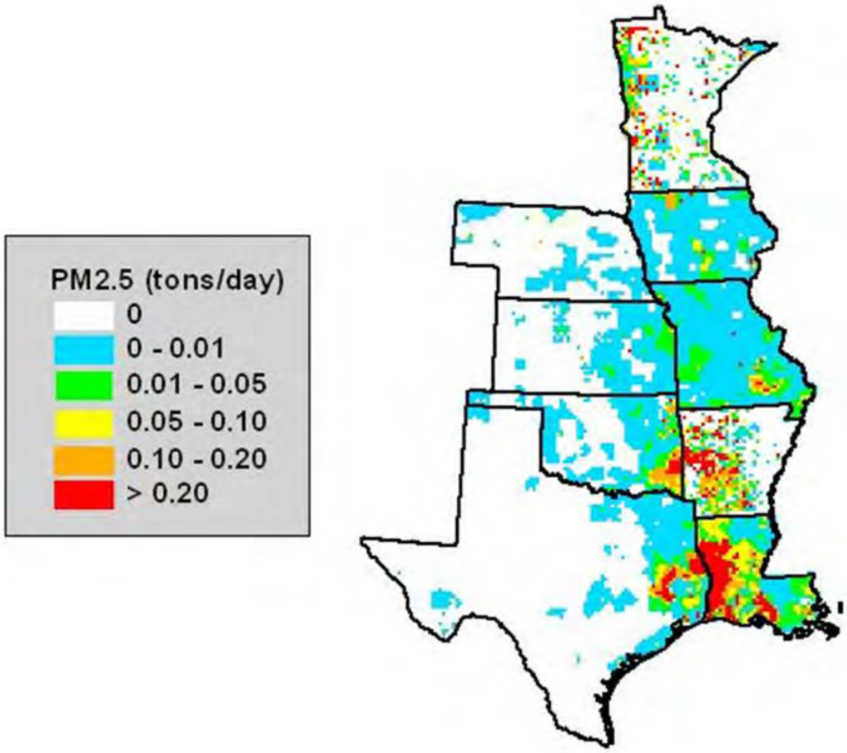

Figure 2-3. Example map of daily $PM_{2.5}$ emissions from prescribed burning (for April 10, 2002).

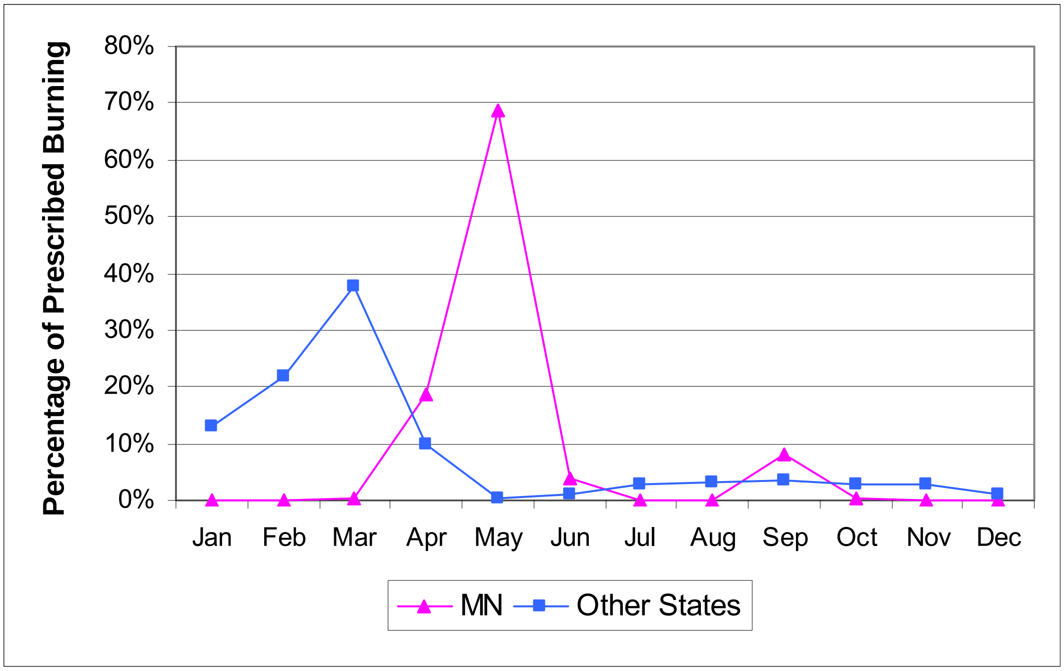

Figure 2-4. Monthly variation in emissions from prescribed burning.

2.1.2 Assessment of Prescribed Burning Emissions

The "bottom up" activity data gathered for the prescribed burning portion of this inventory improved the reliability of the emissions estimates. Virtually all of the burn records for federal lands (and some state burns) include fire date and location information that allows for the use of day-specific fuel moisture settings in calculating emission factors. Location information also enabled these burns to be treated as point sources for spatial allocation purposes.

As shown in Figure 2-3, emissions from prescribed burning are most significant in the region from western Arkansas/Louisiana to eastern Texas/Oklahoma. This is to be expected because prescribed burning is more widely practiced in the southern United States than in other areas (Cleaves et al., 1998). Moreover, the estimate of 137,310 acres burned on wildlands in Texas is within the range of prescribed burning estimates made for that state in 1996 and 1997, when 63,790 acres and 160,890 acres were burned, respectively (Dennis et al., 2002).

Prescribed burning accounts for about 30% of the annual planned burning $PM_{2.5}$ emissions in the CENRAP region. However, emissions from this source category actually exceed those from agricultural burning for five states: Arkansas, Iowa, Louisiana, Minnesota, and Missouri. When only those states are considered, prescribed burning accounts for about 80% of the annual planned burning $PM_{2.5}$ emissions.

Areas of uncertainty related to prescribed burning emissions estimates arise from differences in how fire activity is tracked and reported in each state. For example, for Arkansas, Minnesota, and the northeastern portion of Oklahoma, fire data is available at an "incident

level," meaning a fire's date and location were listed in each fire history record. However, other states did not track this level of detail, instead reporting fire data by region and month, for example. In these cases, individual fire events could not be treated as point sources, and the geographic and temporal resolution of the final inventory was limited as a result.

Differences from state to state are even more pronounced for burns occurring on privately held lands. Such burns are performed by individuals, private companies, and organizations such as TNC and the Audubon Society. However, permitting or reporting requirements are not consistent among the nine CENRAP states, and few stable were able to provide us with reliable data on these burns.[3] Persistent attempts were made to contact private companies and organizations, but only TNC was able to provide burn data within the time limits of this project. It should be noted, though, that most burns on private lands are likely to be related to agriculture or waste management (such as the burning of logging residue by forestry companies or pile burns by land developers) (Altman, 2004; Miedtke, 2004). The former types of burns are covered by the agricultural survey, while the latter burns are not included in the scope of this project.

2.2 EMISSIONS FROM AGRICULTURAL BURNING

2.2.1 Summary of Emissions from Agricultural Burning

Emission estimates were generated for agricultural burning activities on private rangeland and cropland in each of the CENRAP states. It was determined that agricultural burning resulted in the burning of about 13 million acres in 2002 in the CENRAP region, with consequent $PM_{2.5}$ emissions of over 200,000 tons (see **Table 2-2**).

Table 2-2. 2002 acres burned and emissions (tons) for agricultural burning in CENRAP states.

STATE	Acres Burned	PM_{10}	$PM_{2.5}$	NO_x	SO_2	NH_3	VOC
Arkansas	655,307	10,771	10,227	3,692	637	2,100	6,254
Iowa	2,247	44	42	5	1	4	20
Kansas	5,015,790	99,170	75,057	29,094	10,937	11,436	54,884
Louisiana	486,441	8,384	7,888	3,845	609	2,453	7,066
Minnesota	101,925	1,944	1,729	358	69	248	1,155
Missouri	290,978	4,958	4,314	1,907	520	693	2,500
Nebraska	215,526	4,647	3,609	643	244	553	2,950
Oklahoma	2,303,359	45,231	35,228	18,645	6,653	5,124	23,992
Texas	3,798,581	104,709	74,393	13,647	8,725	12,573	63,396
Total	12,870,154	279,858	212,486	71,836	28,395	35,185	162,218

[3] Exceptions include the state of Arkansas, which was able to provide a database of virtually all burns in the state larger than 5 acres, including those occurring on private lands. The same was true for a 15-county region of Oklahoma that requires burn permits. The state of Minnesota also requires permits for all prescribed burning activities (including private burns), but does not keep centralized records of these burns.

Emissions from agricultural burning contribute 70% to total planned burning estimated $PM_{2.5}$ emissions for the CENRAP region, ranging from 1% to 99% of total planned burning emissions from state to state. The most important crop/land use types are rangeland (especially in the states of Texas, Oklahoma, and Kansas) and wheat (especially in the states of Kansas, Oklahoma, and Arkansas), although sugarcane burning is significant in the state of Louisiana. **Figures 2-5 and 2-6** illustrate the overall emission levels by state and the relative importance of each crop type in each state, and **Figure 2-7** shows the geographic allocation of agricultural burning emissions throughout the CENRAP region.

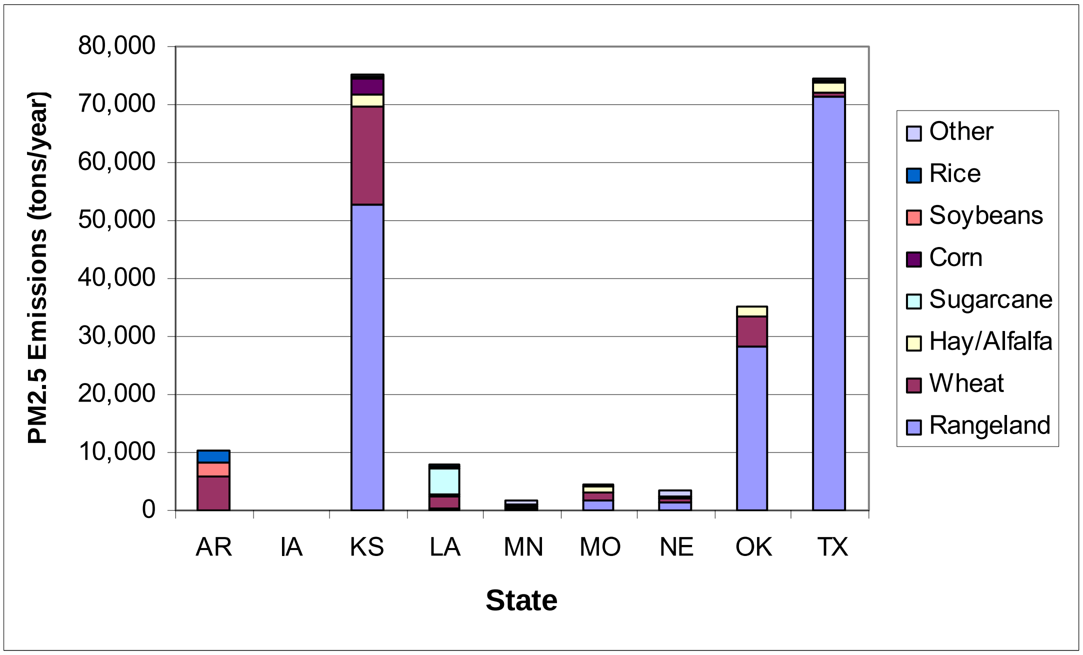

Figure 2-5. $PM_{2.5}$ emissions from agricultural burning by state.

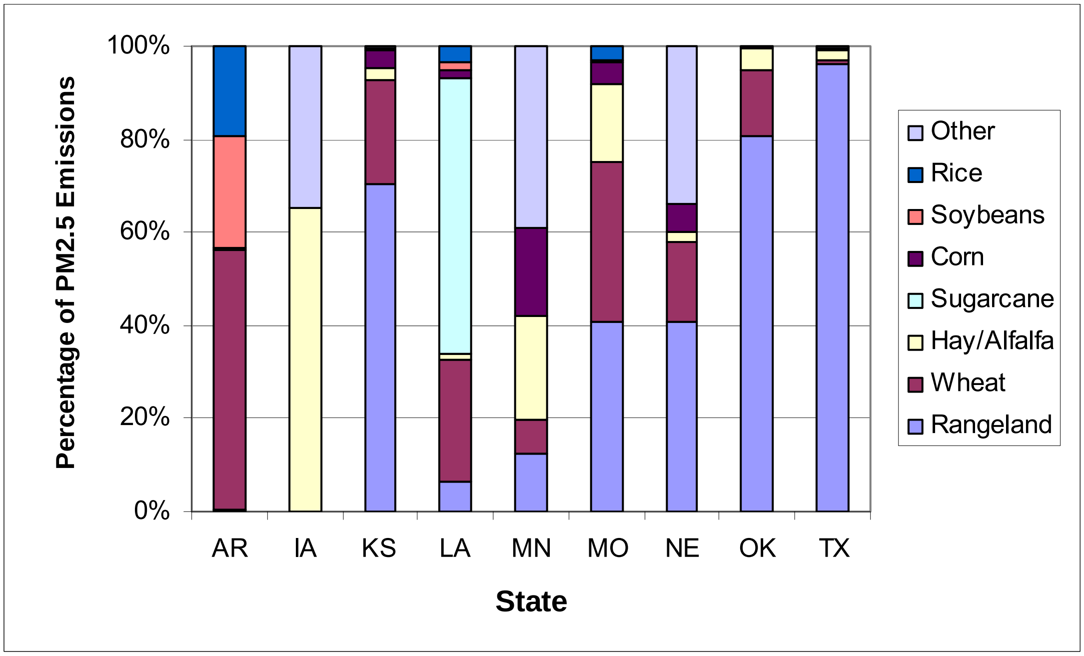

Figure 2-6. Percent contribution by crop type to state $PM_{2.5}$ emissions from agricultural burning.

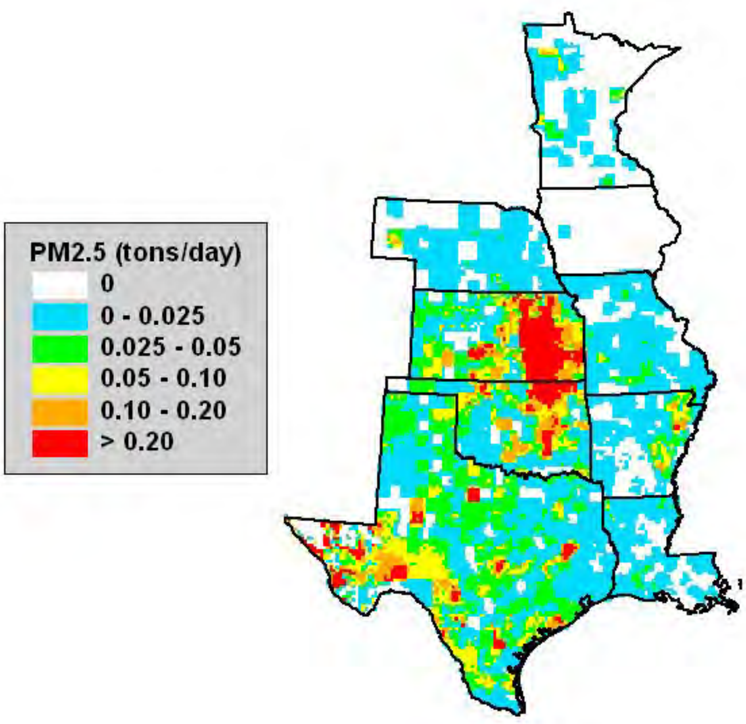

Figure 2-7. Example map of daily agricultural burning emissions (for April 10, 2002).

Emissions from agricultural burning tend to follow a bimodal pattern of seasonal variability, with large peaks in the spring and smaller peaks in the fall (see **Figure 2-8**). For most states, the month with the highest emissions from agricultural burning is March, although northern states like Minnesota and Iowa show a spring peak in May. For Arkansas and Louisiana, the highest emissions occur in September and October, respectively, which is due to the large acreages of winter wheat (Arkansas) and sugarcane (Louisiana) burned in those states.

2.2.2 Assessment of Emissions from Agricultural Burning

The "bottom up" survey data gathered for the agricultural burning portion of this inventory made it possible to generate emissions estimates that take into account county-level burn practices for each CENRAP state, including information on the timing of burns and the techniques used to burn individual crops.

This study indicates that agricultural burning practices vary widely from state to state and even county to county. For example, 54 of the 56 counties surveyed in Iowa reported no agricultural burning, as did 50 of the 77 counties surveyed in Minnesota. Among states that do burn extensively, practices vary by crop type. The survey indicates that burning is widely used to destroy wheat stubble in Arkansas, as over 40% of that crop is burned each year. By contrast, no other state that grows significant amounts of wheat burns more than 15% of the crop annually.

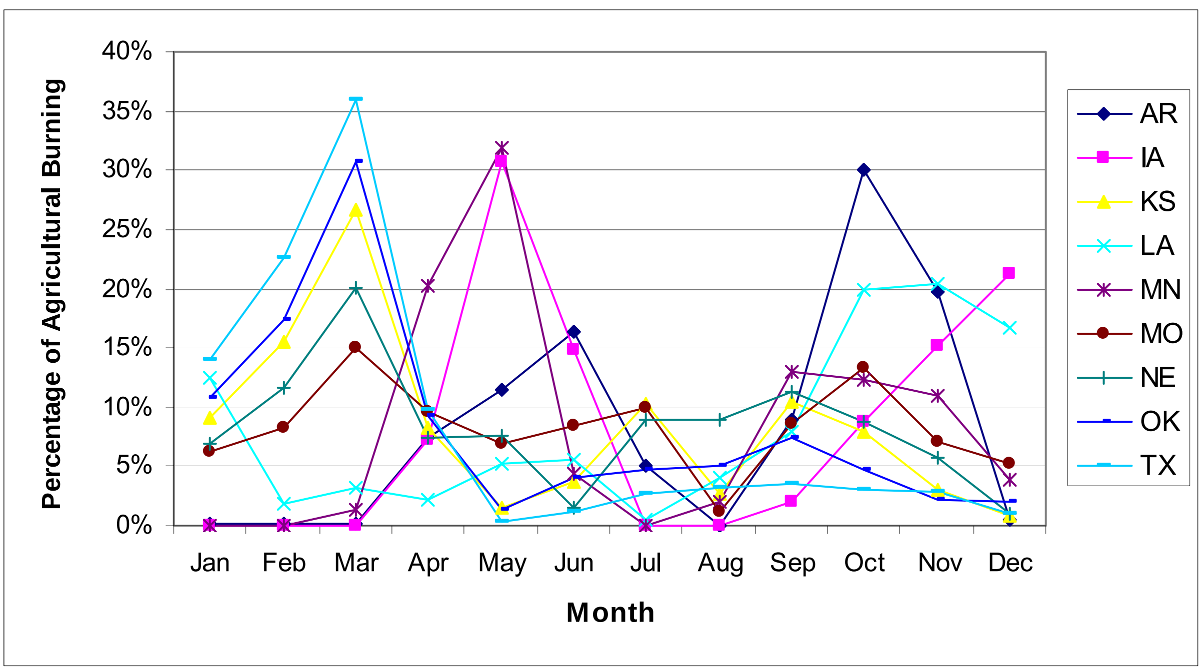

Figure 2-8. Monthly variation in emissions from agricultural burning by state.

It is also important to note that while agricultural burning accounts for about 70% of the annual $PM_{2.5}$ emissions from planned burning activity for the CENRAP region as a whole, almost 90% of the agricultural burning emissions occur in three states: Texas, Oklahoma, and Kansas. Moreover, about 70% of all agricultural burning emissions in the CENRAP states result from the burning of rangeland in these three states.

Uncertainties related to agricultural burning emissions result largely from an incomplete understanding of local regulations pertaining to such burning. For example, several states with a significant number of counties including Iowa, Minnesota, Nebraska, and Missouri reported no agricultural burning. These reports of no burning may be due to local restrictions on agricultural burning or other factors. Also, survey responses for each state were extrapolated to generate a statewide burn profile by crop type, and these profiles were used to represent all counties for which no survey data were available. However, further investigation is necessary to determine if burn practices vary within individual states enough to warrant subdividing certain states into regions.[4]

2.3 MISCELLANEOUS BURNING SOURCE CATEGORIES

Several subcategories of miscellaneous prescribed burning occur within the CENRAP region. Most of these burn types relate to the disposal of waste materials and, therefore, were not included in the final emissions inventory. However, some information on these burns was gathered during the course of the project and is summarized below.

<u>Slash and Site Preparation Burning</u>

Slash burning is typically used to dispose of logging residue produced by the harvesting or trees and, as such, is most often practiced by private timber companies. Based on employment estimates for the logging industry (U.S. Census Bureau, 2003), states in the CENRAP domain that produce significant amounts of timber are Arkansas, Louisiana, Minnesota, and Texas (see **Table 2-3**).

Table 2-3. 2001 logging industry employment by state.

State	Number of employees
Arkansas	2,914
Iowa	175
Kansas	65
Louisiana	3,325
Minnesota	1,019
Missouri	378
Nebraska	65
Oklahoma	281
Texas	2,227

[4] A subregional approach was used for wheat and rangeland burning in the state of Kansas, and such an approach may be applicable to other states/crop types.

To illustrate the relative significance of slash burning, Allen & Dennis (2000) report 55,000 acres of logging-related slash burning in Texas during 1997, about 3% of the total planned burning acreage for that year. In the fire history data obtained by STI (which mostly pertains to burning on publicly-managed lands), very few burns were identified as slash burns—amounting to 400 acres in Minnesota and less than 5 acres in Oklahoma and Iowa (no other states identified burns as slash).

Additionally, the state of Arkansas reports 50,000 acres of "site preparation burning," which are burns largely conducted by the timber industry to prepare lands for reforestation. It is likely that some of these burns involve slash fuels, though fuel model information was not tracked in the Arkansas database. Similarly, significant numbers of site preparation burns were included in the data we received from the state of Minnesota, though these burns were not identified as such (Miedtke, 2004).[5] Note for both Arkansas and Minnesota, these burns were included in the inventory but not assigned the higher fuel loadings that would be associated with slash fuels.

Pile Burning

As the name suggests, "pile" burning involves disposing of waste material by gathering the material into piles and burning it. Types of waste material include leaves and yard waste, logging residue, and brush or trees cleared from land for development purposes. With the exception of the state of Oklahoma, very few pile burns were included in the data provided to STI. For Oklahoma, a 15-county region in the northeastern part of the state that requires burn permits reported 180 incidents of leaf burning and 570 incidents of brush pile burning for 2002 (750 total). However, no data were provided on the sizes of these burns. The state of Minnesota also requires permits for private burns, and approximately 60,000 such permits were issued in 2002. It was estimated that 65% (39,000) of these permits would correspond to either pile burns or ditch/fencerow burns (covered in the next section), with the remaining 35% largely represented by burns on open land and rangeland that would be captured by the agricultural survey (Meadows, 2004).

To roughly estimate the possible emissions resulting from pile burns in Oklahoma and Minnesota, a fuel loading for a sizeable[6] pile burn published by the California Air Resources Board (2003) and emission factors published by the U.S. Environmental Protection Agency (2003) were applied to the number of pile burns in those states. (It was assumed that half of the 39,000 permits referenced above were for pile burns, and the 750 pile burns in Oklahoma were multiplied by 5 to extrapolate from 15 counties to all 77 counties in the state). $PM_{2.5}$ emissions were estimated as follows:

$$\text{OK: } PM_{2.5} = (750 \text{ x } 5) \text{ piles x } \frac{1.36 \text{ tons}}{\text{pile}} \text{ x } \frac{14 \text{ lbs - } PM_{2.5}}{\text{ton}} \text{ x } \frac{\text{ton}}{2000 \text{ lbs}} = 36 \text{ tons}$$

[5] Personnel at the Minnesota Dispatch of the National Interagency Fire Center estimated that 75% of the site preparation burning in Minnesota was included in the data provided to STI. Site preparation burns not included in the data set would be those conducted by private landowners or companies.
[6] Fuel loadings for a burn 12 feet in diameter and 8 feet high were used.

$$\text{MN: } PM_{2.5} = (39{,}000 / 2)\text{ piles x } \frac{1.36\text{ tons}}{\text{pile}} \text{ x } \frac{14\text{ lbs - }PM_{2.5}}{\text{ton}} \text{ x } \frac{\text{ton}}{2000\text{ lbs}} = 186\text{ tons}$$

For Oklahoma and Minnesota, these pile burns represent only 0.1% and 1.1%, respectively, of the $PM_{2.5}$ emissions already included in the planned burning inventory for these states. Pile burns in other states cannot be characterized with the data currently available.

Ditch and Fencerow Burning

Fires are sometimes used for weed abatement purposes along roadsides and fencerows. In the data obtained by STI, no individual fires were identified as ditch or fencerow burns, and because such fires are generally small in scale and practiced by private parties, it is likely that few such burns are included.

The only state where some assessment of these burns appears to be possible is Minnesota. As previously stated, approximately 39,000 of the 60,000 burn permits issued in that state each year are for pile burns and ditch/fencerow burns. To provide a rough estimate of emissions from this source, it was assumed that half these 39,000 burns were ditch burns, and that each burn covered 0.25 acres (Meadows, 2004). Using emission factors published by the U.S. Environmental Protection Agency (2003), $PM_{2.5}$ emissions were estimated as follows:

$$PM_{2.5} = (39{,}000 / 2)\text{ burns x } \frac{0.25\text{ acres}}{\text{burn}} \text{ x } \frac{1\text{ ton}}{\text{acre}} \text{ x } \frac{15\text{ lbs - }PM_{2.5}}{\text{ton}} \text{ x } \frac{\text{ton}}{2000\text{ lbs}} = 37\text{ tons}$$

This estimate amounts to only 0.2% of the 16,000 tons of $PM_{2.5}$ already included in the planned burning inventory for Minnesota. Ditch and fencerow burns in other states cannot be characterized with the data currently available.

3. SUMMARY AND ASSESSMENT OF THE AIR QUALITY DATA ANALYSIS

3.1 OBJECTIVE AND APPROACH

The objective of this analysis was to use ambient speciated $PM_{2.5}$ data from Class I areas (from the Interagency Monitoring of Protected Visual Environments [IMPROVE] network) in the CENRAP states along with the planned burning emissions estimated in this study to assess whether ambient data can be used to identify planned burning contributions to visibility events in Class I areas, and to perform a preliminary assessment of the impact of planned burns on $PM_{2.5}$ and visibility at a few monitoring sites. The following approach was employed:

- Assess the seasonal chemical compositions of $PM_{2.5}$ mass and aerosol light extinction to determine what individual species are important to the mass and visibility extinction in the area.
- Determine seasonal concentrations of and ratios between selected species, such as OC, EC, and K, to establish a "baseline" average seasonal composition for comparison to days of poor visibility and days potentially influenced by prescribed burning.
- Assess chemical compositions of $PM_{2.5}$ and aerosol light extinction on the 20% best and 20% worst visibility days to determine what species have a large impact on visibility (i.e., are species from burning typically important in visibility reduction?).
- Analyze IMPROVE data, specifically OC, EC, and K concentrations, on dates when extensive burning occurred near a monitoring site in order to assess whether wood smoke influences are seen in the ambient measurements and significantly impact visibility.
- Analyze emissions data on days when elevated OC, EC, and K concentrations occurred at IMPROVE sites to determine whether days of elevated concentrations corresponded to known burns in the emission inventory data.
- Analyze air mass trajectories on selected days to determine whether meteorology (i.e., transport) explains the observed effects and to determine the extent to which meteorology affects haze.

3.2 SUMMARY OF FINDINGS

Details on data, methodology, and results from this analysis are provided in Appendix C. This work yielded the following findings:

- Speciated $PM_{2.5}$ data can be used to determine influence from planned burns when the meteorology is conducive to transport from the burn area to a Class I site.
- Smoke constituents, specifically EC and K, were not a significant fraction of the $PM_{2.5}$ mass and light extinction, even on days when there was evidence of planned burning influence, at the sites examined in this preliminary study.
- Ammonium sulfate, which is not generated from burning, is the dominant constituent of the $PM_{2.5}$ mass and light extinction, especially on the 20% worst visibility days. This

finding is consistent with other work in the Midwest and CENRAP regions including studies of Big Bend National Park and Seney Wildlife Refuge.

- On some days, influences from known prescribed burns were seen, though they were generally less than 10% of the $PM_{2.5}$ mass and light extinction. Improved spatially and temporally resolved emission inventories and additional case studies may show different results.
- The specific influence of smoke on $PM_{2.5}$ mass and light extinction could be better quantified using additional analyses, including source apportionment.

4. RECOMMENDATIONS FOR FURTHER RESEARCH

This study provided an improved and updated emission inventory for planned burning in the CENRAP states for year 2002. Preliminary examination of ambient measurements along with the inventory generated in this study suggests that planned burning may contribute to visibility impairment at Class I sites in the CENRAP states. As noted in previous sections of this report, we identified the following significant sources of uncertainty (roughly in order of importance): (1) the extent of fires performed by the USFS on publicly managed lands, (2) the extent of prescribed burning on privately held lands performed by the forestry industry and organizations such as TNC, (3) a need to better understand county-level open burning regulations, and (4) the fuel loadings and emission factors used for planned burning emissions estimates—particularly for prescribed burning in the state of Minnesota. In this section, we provide recommendations for improving each of these aspects of the inventory and describe additional analyses that could be conducted to better quantify the influence of planned burning on visibility impairment.

4.1 RECOMMENDATIONS FOR IMPROVING PRESCRIBED BURNING ACTIVITY DATA

As discussed in Section 2.1.2, significant differences exist in the way fire activity data is tracked and reported in each state; some states (such as Arkansas and Minnesota) capture a fire's exact date and location coordinates, and other states track fires only by region and month. Encouraging individual states to maintain "incident level" databases of fire activity would allow all prescribed fires to be treated as discrete point sources and improve the geographic and temporal resolution of the inventory.

Also, differences from state to state are even more pronounced for burns performed on privately held lands by individuals, private companies, and organizations such as TNC and the Audubon Society. However, permitting or reporting requirements are not consistent among the nine CENRAP states, and few states were able to provide us with reliable data on these burns.[7] Persistent attempts were made to contact private companies and organizations, but only TNC was able to provide burn data within the time limits of this project. It is recommended that further efforts be made to survey private parties regarding their burn activities, especially in the Piney Woods region of eastern Texas, where private timber companies have conducted significant amounts of prescribed burning in past years (Allen & Dennis, 2000)[8].

It should be noted, though, that most burns on private lands are likely to be related to agriculture or waste management (such as the burning of logging residue by forestry companies

[7] Exceptions include the state of Arkansas, which was able to provide a database of virtually all burns in the state larger than 5 acres,--including those occurring on private lands. The same was true for a 15-county region of Oklahoma that requires burn permits. The state of Minnesota also requires permits for all prescribed burning activities (including private burns), but does not keep centralized records of these burns.

[8] For purposes of this inventory, acres burned in 1996 and 1997 by private timber companies in the Piney Woods region were averaged to produce an estimate of 20,000 acres per year.

or pile burns by land developers) (Altman, 2004; Miedtke, 2004). The former burns are covered by the agricultural survey, and the latter burns are not included in the scope of this project.

Finally, alternative and newly emerging data sources such as satellite data and related products recently developed by the National Oceanic and Atmospheric Administration (NOAA) should be explored to help characterize fire locations and day-specific activity levels.

4.2 RECOMMENDATIONS FOR IMPROVING AGRICULTURAL BURNING ACTIVITY DATA

As stated in Section 2.2.2 of this report, uncertainties related to agricultural burning emissions result largely from an incomplete understanding of local regulations pertaining to such burning. Several states, including Iowa, Minnesota, Nebraska, and Missouri, had significant numbers of counties that reported no agricultural burning. It is recommended that further investigation be undertaken to gain a fuller understanding of county-level open burning restrictions, as well as an estimate of how such restrictions are enforced. Further discussions with county AES, as well as with individual farmers, could be used to acquire this information.

Also, survey responses for each state were extrapolated to generate a statewide burn profile by crop type, and these profiles were used to represent all counties for which no survey data were available. For the state of Kansas, however, subregional burn profiles were developed for wheat and rangeland burning, and further investigation is needed to determine if burn practices across other states vary enough to warrant subdividing these states into regions for certain crop types.

4.3 RECOMMENDATIONS FOR IMPROVED FUEL LOADINGS AND EMISSION FACTORS

Emission factors are often a subject of research, and it is recommended that efforts be made to identify and incorporate improved emission factors related to prescribed and agricultural burning that are published in the future. Also, although the default fuel loading values by vegetation type contained in the FOFEM model were judged to be sufficiently representative of conditions in the CENRAP region, some effort should be made to study these fuel loadings further. During the course of this project, personnel at the USFS in Minnesota indicated that the default fuel loadings in FOFEM are regularly updated during the analysis of burns in that state. STI was provided with adjusted fuel loadings for several vegetation and fuel types, most of which were related to “blowdown” burns (the burning of vegetation after storms to reduce fire hazard). These altered fuel loadings resulted in $PM_{2.5}$ emission factors up to 70% higher than those calculated with FOFEM default loadings. When these adjusted emission factors were applied to 3700 acres of burns identified by USFS personnel as blowdown, the prescribed burning portion of the $PM_{2.5}$ inventory for Minnesota increased by about 5%.

4.4 RECOMMENDATIONS FOR ADDITIONAL AMBIENT DATA ANALYSIS

In addition to improvements to the emission inventory, additional analyses could be conducted to better quantify the influence of burns on visibility impairment:

- Apply similar analyses to additional IMPROVE sites, such as these in Kansas or Minnesota, to investigate whether results of this task are indicative of the influence of burns throughout the CENRAP region.
- Utilize continuous $PM_{2.5}$ in conjunction with meteorological data to determine what meteorological conditions may be responsible for changes in $PM_{2.5}$ concentrations.
- Apply source apportionment tools such as UNMIX or Positive Matrix Factorization (PMF) to quantify influence of specific source types at a site using 24-hr (i.e., IMPROVE, Speciated Trends Network [STN], etc.) or continuous speciated data (such as at Bondville or St. Louis). These tools can be used to identify individual sources such as diesel, wood burning, etc.

1. INTRODUCTION

The Central States Regional Air Planning Association (CENRAP) is researching visibility-related issues for its region, which includes the states of Texas, Oklahoma, Louisiana, Arkansas, Kansas, Missouri, Nebraska, Iowa, and Minnesota, and is developing a regional haze plan in response to the U.S. Environmental Protection Agency's (EPA) mandate to protect visibility in Class I areas. In order to develop an effective regional haze plan, the CENRAP ultimately must develop a conceptual model of the phenomena that lead to episodes of low visibility in the CENRAP region. It is recognized that episodic combustion events (such as agricultural burning, prescribed burning, open burning of wastes, structural fires, and wildfires) sometimes contribute to regional or local haze events in the CENRAP region. Therefore, it is important to develop the emissions data necessary to assess the impacts of these events on visibility in the CENRAP region.

In support of the CENRAP's need to develop a regional haze plan, Sonoma Technology, Inc. (STI) developed emission inventories of episodic combustion events for the CENRAP region. Consistent with the project goals presented in the Work Plan (Coe, 2003), the scope of the inventories will be limited to agricultural and prescribed burning. Wildfires, structural fires and waste burning (such as the "slash" burning of logging residue) were not considered in the development of these inventories.

1.1 SUMMARY OF RECOMMENDED METHODS

To develop emission inventories of planned burning activities for the CENRAP region, we employed existing models and information: the First-Order Fire Effects Model (FOFEM), emission factors gathered from published literature, and Geographic Information Systems (GIS) databases of land cover and vegetation. In addition, we gathered new information through telephone and mail surveys.

FOFEM, a computing tool developed through the Joint Fire Science Program (JFSP), can be used to predict a variety of effects from fires on forested lands and rangelands, including air pollutant emissions, fuel consumption, tree mortality, and soil heating (Reinhardt et al., 2003; Reinhardt et al., 1997). For this project, the FOFEM model was used to generate estimates of fuel loadings and emission rates for prescribed burns. This data was then used in conjunction with prescribed burning history information (detailing the location, land type, season, and size of burn incidents) to calculate emissions from this source. Fire history data for prescribed burning on wildlands, publicly managed lands, tribal lands, and private lands were gathered from federal and state agencies, as well as some private organizations.

For agricultural burning, emission factors and fuel-loading factors for a variety of crop types have been published in the EPA's guidance document, "Compilation of Air Pollutant Emission Factors (AP-42)" (U.S. Environmental Protection Agency, 2003) and by Jenkins et al. (1996). From these sources, we identified fuel loading factors and emission factors for a wide variety crop types. These factors were applied to county-specific agricultural burning activity data to generate emissions estimates. This activity data was obtained through systematic telephone and mail surveys of county Agricultural Extension Services (AES).

For both prescribed and agricultural burning activities, the EPA's Biogenic Emissions Landcover Database (BELD) Version 3 (U.S. Environmental Protection Agency, 2001) was used to generate spatial distributions of vegetation types, which in turn were used to select vegetation-specific fuel loading factors output by FOFEM. To do this, cross-walks were established to link the vegetation types in the BELD database with (a) vegetation types in FOFEM and (b) crop types for which emissions factors and fuel loadings are available.

Once a map of vegetation and crop types was developed, we overlaid histories of planned fires, identified the vegetation types associated with each fire occurrence, and applied emission factors generated through FOFEM or acquired from the sources described above to produce county-level emission inventories of agricultural and prescribed burning. **Table 1-1** summarizes sources of emission factors, activity data, and land cover data.

Table 1-1. Summary of approaches to estimate planned-burning emissions.

	Prescribed Burning	Agricultural and Rangeland Burning
Emission factors	FOFEM Model	AP-42; (Jenkins et al., 1996)
Fire history data	Federal and state agencies; telephone contacts with tribes and private owners of large land tracts	Telephone and mail surveys of County Agricultural Extension Services
Land cover data	EPA's BELD3 database	EPA's BELD3 database

1.2 IMPORTANT ASSUMPTIONS

The methods that we selected for use were based on several important assumptions:

- Default fuel loading values by vegetation type contained in the FOFEM model are sufficiently representative of conditions in the CENRAP region[1].
- The land cover/vegetation types used by the FOFEM model and those in the BELD database are similar enough to allow a reasonable cross-walk to be established between the two data sets.
- The crop types in the BELD database are similar enough to crop varieties for which emission factors and fuel loadings are available to allow a reasonable cross-walk to be established between the two data sets.
- County AES will be capable of providing responses that reasonably represent agricultural and rangeland burning activities in the CENRAP region.

[1] Personnel at the U.S. Forest Service in Minnesota provided updated fuel loadings for 3,700 acres of grassland burns and "blowdown" burns (the burning of vegetation after storms to reduce fire hazard) occurring in the Superior National Forest in 2002. Default fuel loadings were used in all other cases.

2. AGRICULTURAL BURNING

2.1 OVERVIEW

Agricultural burning is primarily a means of clearing harvested lands. Because the CENRAP region is largely agricultural, such activity is likely to be a source of significant episodic combustion emissions in most counties. Allen and Dennis (Allen and Dennis, 2000; Dennis et al., 2002) recently completed a study of emissions from fires in Texas, which included agricultural and rangeland burning in 1996 and 1997. According to their assessments, these types of agricultural activities emitted over 66,000 tons of particulate matter of less than 2.5 μm aerodynamic diameter ($PM_{2.5}$) and accounted for 84% of over 3.3 million acres of vegetation burned in Texas during those two years.

2.2 AGRICULTURAL BURNING EMISSION FACTORS AND FUEL LOADINGS

Emissions from agricultural burning activities are dependent on the types of vegetation burned and the manner of combustion, and can be estimated using the following equation:

*Emissions (lb) = Fuel loading (ton/acre) * Emission factor (lb/ton) * Acres burned*

In its Compendium of Air Pollutant Emission Factors, (AP-42) (U.S. Environmental Protection Agency, 2003), the EPA provides fuel loadings and emission factors for particulate matter (PM), carbon monoxide (CO), methane (CH_4), and non-methane hydrocarbons (NMHC) for a variety of field and orchard crops. In some cases, AP-42 emission factors are provided for two different burning techniques: headfire burning (when a fire is started on the upwind side of a field) and backfire burning (when a fire is started downwind). In addition, a more recent study at the University of California at Davis derived emission factors for the combustion of barley straw, corn stover, rice straw, wheat straw, and almond tree prunings (Jenkins et al., 1996). In this study, emission factors for CO, total hydrocarbons (THC), nitrogen oxides (NO_x), sulfur dioxide (SO_2), and PM were based on measurements collected during wind tunnel tests.

Fuel loadings and emission factors are provided in **Table 2-1**. For barley, corn, rice, wheat, and almonds, emission factors were derived entirely from Jenkins' (1996) study using average emission rates and moisture contents from two wind tunnel configurations. An emission factor for volatile organic compounds (VOC) was derived from Jenkins' THC values by using the fraction of reactive gases equal to 0.5698 that was published in a California Air Resources Board (CARB) guidance document (Gaffney, 2000). For the remaining crops, emission factors for NO_x and SO_2 were set equal to Jenkins's average values for field or orchard crops, and emissions factors for VOC were calculated from the CH_4 and NMHC values reported in AP-42, again by using the CARB fraction of reactive gases. The emission factors for CO were taken directly from AP-42, and particulate matter of less than 10 μm aerodynamic diameter (PM_{10}) and $PM_{2.5}$ were calculated from the PM values in AP-42 by using fractions of 0.9835 for PM_{10} and 0.9379 for $PM_{2.5}$ for field crops and fractions of 0.9814 for PM_{10} and 0.9252 for $PM_{2.5}$ for orchard crops based on CARB's guidance (Gaffney, 2000). Fuel loadings were taken from AP-42 for all crop types. (For grasses and wild reeds, which were not reported in AP-42, the value for wild hay was used.)

Table 2-1. Fuel loadings and emission factors for agricultural burning.

2.3 AGRICULTURAL BURNING ACTIVITY DATA

To obtain activity data for agricultural burning events in the CENRAP region, STI's subcontractor, Population Research Systems (PRS), conducted systematic telephone and mail surveys of county AES offices. PRS attempted to contact each AES office in all 969 counties of the CENRAP region in order to recruit AES personnel to complete a telephone survey. This survey was designed to determine the fraction of each county's acreage typically burned each year by crop type, the timing of such burn events, and the burn methods employed. Data collected through the survey was then applied to National Agricultural Statistics Service (NASS) county-level estimates of acreages grown by crop type for 2002.

This data collection effort had a target response rate of 25% to 50%. Ultimately, 549 contacts were made, for a response rate of 56% (ranging from 36% to 93% from state to state). By including such large proportions of the available respondent pool and the total geographic area of the CENRAP region, the achievable representativeness of the study was maximized and the potential uncertainties minimized. Survey responses were used to generate profiles of agricultural burning practices by geographic region and crop type. In general, profiling was done on a statewide basis for each crop: a regional average burn profile was used to represent all counties for which no survey data are available. However, personnel at the Kansas Department of Health and Environment divided the state of Kansas into three subregions for wheat burning and four subregions for rangeland burning. Separate burn profiles for the burning of wheat and rangeland were produced for each of these subregions and applied to counties within those subregions for which no survey data were available.

The proposed survey questionnaire is provided in Appendix A, and maps displaying Kansas subregions for wheat and rangeland burning are provided in Appendix C.

2.4 SPATIAL ALLOCATION OF AGRICULTURAL BURNING

Agricultural burning was spatially allocated by using the BELD GIS database. The BELD database includes spatial distributions of crops (by crop type) at the county (and sub-county) level gridded to 1 km^2. Activity data obtained through the agricultural survey questionnaires about the types of crops burned at the county level was spatially allocated by matching the reported crop types from the questionnaire to the crop types in the BELD database by county. The fire activity data was applied to the area (acreage) of crops by county for the purposes of calculating countywide emissions. Gridded surrogate data, or spatial allocation factors, were developed by gridding the agricultural burn activity data and corresponding crop types to the 12-km $\times$ 12-km national Regional Planning Organization (RPO) grid domain.

2.5 TEMPORAL ALLOCATION OF AGRICULTURAL BURNING

Agricultural burning, like other agricultural activities, has a distinct seasonal pattern, although this pattern tends to vary by crop type and region. To identify such seasonal patterns in the CENRAP region, the survey of agricultural experts contained questions designed to identify times of the year when agricultural burning takes place for the various crops grown in each of the CENRAP states. Survey responses were used to design seasonal profiles that characterize agricultural burning activities by state and crop type.

The survey also contained questions related to weekly and diurnal variations in agricultural burning activities. These questions were designed to identify the fraction of agricultural burning that takes place on weekdays versus weekend days, as well as the fraction of burning that takes place during daylight hours versus nighttime hours.

2.6 CHEMICAL SPECIATION OF AGRICULTURAL BURNING

PM and VOC emissions were chemically speciated according to profiles published by the EPA and the CARB. **Table 2-2** summarizes the profile references and the individual compounds included in the profiles. Using these references, we created speciation profiles and cross-reference files according to SMOKE speciation schemes.

Table 2-2. Chemical speciation of agricultural burning: profile information.

Profile Name	Profile Number	Profile Source	Source Category SCC Code	SCC Description	Reference	Proposed Classification Schemes	Individual Compounds
PM							
Agricultural Burning – Field Crops	430	ARB	CARB SCC Code 67066202620000 (assumed to correspond to EPA SCC Code 2801500000)	Waste Burning – Agricultural Debris – Field Crops	(Jenkins et al., 1996)	Default SMOKE classification scheme and individual compounds	Aluminum, Ammonia, Antimony, Arsenic, Barium, Bromine, Cadmium, Calcium, Elemental Carbon, Organic Carbon, Chlorine, Chromium, Cobalt, Copper, Gallium, Gold, Indium, Iron, Lanthanum, Lead, Manganese, Mercury, Molybdenum, Nickel, Nitrates, Palladium, Phosphorous, Potassium, Rubidium, Selenium, Silicon, Silver, Sodium, Strontium, Sulfur, Thallium, Tin, Titanium, Uranium, Vanadium, Yttrium, Zinc, Zirconium, Unidentified
VOC							
Miscellaneous Burning – Forest Fires	0307	EPA	2801500000	Miscellaneous Area Sources – Agriculture Production – Crops – Agricultural Field Burning – Whole Field Set on Fire – Total, all crop types	(Sandberg et al., 1975)	Default SMOKE classification scheme (Carbon Bond IV) and individual compounds	Acetylene, 1,3-Butadiene, N-Butane, 1-Butene,Isomers of Butene, Ethane, Ethylene, Isobutane, 3-Methyl-1-Butene, Propyne, Isomers of Pentane, Propane, Propylene, Unidentified

3. PRESCRIBED BURNING

3.1 OVERVIEW

The purpose of prescribed burning is commonly believed to the clearing of undergrowth in timberlands or grasslands to prevent wildfires or make various types of land improvements. For example, planned burns are used for timber stand improvement (site preparation fires for reforestation projects; removal of diseased trees), range improvement and wildlife habitat improvement. The types and amounts of such burning vary regionally both due to local weather and to local forest/land types.

As with agricultural burning, emission rates are specific to materials burned and burn management practices. Some degree of reporting and record-keeping is required of wildfire prevention efforts by state, federal, and tribal agencies. However, access and interpretation of these records is difficult. Even less information is available for planned burning of undergrowth for private land improvement. As with agricultural burning, significant effort is necessary to develop activity data sets that can be used for regional-scale emissions assessments.

3.2 PRESCRIBED BURNING EMISSION FACTORS AND FUEL LOADINGS

For this project, the FOFEM model was used to generate estimates of fuel loadings and emission rates for prescribed fires which were then applied to estimates of acres burned acquired from fire history data. This model was developed based on research findings gathered from peer-reviewed literature sources, internal agency reports, and other "gray literature" sources. The accuracy and certainty of FOFEM results are consistent with the current status of scientific measurements of fuel consumptions and air emissions for prescribed burning and wildfires. Although measurement data are limited and uncertain, the FOFEM model generally represents a synthesis of the most up-to-date information available.

Required inputs to FOFEM 5.0 include the following:

- Vegetation land cover type
- Season of the year (spring, summer, fall, or winter)
- Moisture conditions (including the moisture content of various fuel types)
- Configuration of the burn (natural conditions, piled fuel, or slash fuel)
- Percent of the tree canopy crown expected to burn (0% for a well-executed prescribed burn)
- Percent of fallen logs that are rotten (default equals 10%)
- Size distribution of fallen logs of 3 in. or greater diameter
  - Even distribution across the size range, from 3 in. to 20+ in.
  - A distribution that tends toward the larger logs
  - A distribution that tends toward the smaller logs
  - A distribution that tends toward the center of the size range
  - A distribution that tends toward the endpoints of the size range.

FOFEM calculates emission factors for PM_{10}, $PM_{2.5}$, CH_4, carbon dioxide (CO_2), CO, NO_x, and SO_2. For ammonia (NH_3) and NMHC, we applied the approximations that were employed by Allen and Dennis (2000), which assumed NMHC and NH_3 emission factors that vary as follows:

$$EF_{NH_3} = EF_{NO_x} \times 14 \times \left(1 - \frac{EF_{CO_2}}{EF_{CO_2} + EF_{CO}}\right) \quad \textbf{(3-1)}$$

$$EF_{NMHC} = 1.52 + (EF_{CH_4} \times 1.232) \quad \textbf{(3-2)}$$

Before FOFEM could be applied to the CENRAP region, it was necessary to determine which of the model's vegetation types are found in the region, and what the moisture contents of various fuel types were at the times and places in which prescribed burning events occurred. (For the remaining FOFEM inputs, such as burn configuration, log-size distributions, and the percentage of fallen logs that are rotten, default settings were used).

FOFEM allows users to choose between two main vegetation cover classifications: the National Vegetation Classification System (NVCS) and the Society of American Foresters/Society for Range Management (SAF/SRM) cover types. (A third option, the Fuel Characteristic Classification [FCC], does not yet cover all regions of the country.) The NVCS uses a classification hierarchy which emphasizes differences in both vegetation structure and floristics[2], and the system is periodically updated to include new information on natural community classifications developed at the state level. Such natural communities are based on all species of vegetation. SAF forest cover types, on the other hand, are based primarily on dominant tree species. While trees can be indicators of their environments, some trees are so broadly adapted that their presence indicates little about the conditions of the surrounding natural community. Thus, SAF cover types are less useful than those found in the NVCS (New Hampshire Division of Forests and Lands, 2002). To determine which of the NVCS or SAF cover types are found in the CENRAP region, a cross-walk was developed between the FOFEM and BELD databases. In developing this cross-walk, BELD vegetation types were matched to NVCS coverage types wherever possible; SAF data was used only when clear matches could not be made to NVCS coverages. The cross-walks used are presented in Appendix B.

Fuel moisture content is the quantity of water in a fuel particle expressed as a percentage of the oven-dry weight of the fuel (National Weather Service, 1998). FOFEM requires settings for three fuel classifications[3]: 10-hour, 1000-hour, and duff[4]. Fuel moisture data are available

[2] Floristics is the study of the number, distribution, and relationships of plant species in one or more areas.
[3] The rate of change of the moisture content is dependent on the diameter of the woody fuel, various diameter ranges are classified according to their "time lag." Time lag refers to the length of time it takes a fuel to respond to changes in environmental moisture conditions: larger diameter fuels generally have longer time lags. The time lag categories typically used for fire behavior and fire danger rating are specified as 1-hr (0-¼"), 10-hr (¼"-1"), 100-hr (1"-3"), and 1000-hr (3" or greater).
[4] Duff is partially decomposed organic matter, leaf litter, or organic soils (such as humus or peat), which accumulates in layers on the forest floor.

from the Wildland Fire Assessment System (WFAS)—a database of the National Interagency Fire Center (NIFC) in Boise, Idaho. WFAS is based on daily weather observations taken at about 1500 fire weather stations throughout the United States and entered into the Weather Information Management System (WIMS). These weather observations are used to calculate fuel moisture levels for 1-hr, 10-hr, 100-hr, and 1000-hr fuel types. WIMS data for the CENRAP region was acquired and used to determine a range of 10-hr, 1000-hr and duff moisture levels for the CENRAP region for 2002. The 100-hr moisture values were used as a surrogate for duff moisture, following the approach of Harrington (2003).

Once vegetation types and fuel moisture levels present in the CENRAP region were determined, FOFEM was run for each unique combination of vegetation type-moisture level to generate emission rates in pounds per acre burned. Outputs from these FOFEM runs were used to produce a look-up table of emission factors by vegetation type and moisture condition. For each prescribed burning event, we were able to use WIMS data from the nearest fire weather station to determine fuel moisture contents for that event and BELD data to determine the type of vegetation burned. This information was used to select and apply an appropriate emission factor from the FOFEM look-up table.

3.3 PRESCRIBED BURNING ACTIVITY DATA

In summary, the prescribed burn activity data for state and private lands from the CENRAP states will consist of detailed data obtained from smoke management programs, state fire marshals, or state forest services; summary data obtained from state agencies and allocated by county; summary data estimated by applying federal surrogates to state lands and allocated by county; and county level data based on the results of the rangeland burning survey questions.

3.3.1 Activity Data for Federal Lands

The National Interagency Fire Management Integrated Database (NIFMID) was the source of data used for prescribed fires occurring on Department of the Interior (DOI) lands (U.S. Fish and Wildlife Service, National Park Service, and Bureau of Indian Affairs [http://famweb.nwcg.gov/weatherfirecd/]). This database contains fire type (prescribed, wildfire, etc.), start and end dates, extent (acres), and location (geographic coordinates and township/range/section).

The National Fire Plan Operations and Reporting System (NFPORS), contains year 2002 fire occurrence data for the U.S. Forest Service (USFS). NFPORS data were used to characterize prescribed fires on USFS lands in the six states with land managed by that agency: Arkansas, Louisiana, Minnesota, Missouri, Oklahoma, and Texas.

Additional prescribed burn data on federally managed lands were included in data acquired from state smoke management programs (this data was cross-checked against NIFMID and NFPORS data to prevent double-counting). For example, some DOI data was included among the state reports that did not appear in the NIFMID final report for 2002, and some USFS burns appeared in these reports as well.

3.3.2 Activity Data for State, Tribal, and Private Lands

Each of the CENRAP states has unique regulations regarding prescribed burning on state and private lands. Records of prescribed burns are compiled at different levels within each state. Consequently, several sources of information contributed to the prescribed burn activity data for state, private, and tribal lands.

In cases where we could not acquire good-quality information about prescribed burns on state lands, the percentage of federal lands that were burned within the state in the year 2002 was used as a surrogate for the percentage of state lands that were burned that year. The total acreage of burned state lands were allocated according to the proportion of state lands within each county. In addition, the temporal profile of the burns that occurred on federal lands within these states was applied to the burns that were estimated for their state lands.

Minnesota, Arkansas and Louisiana have voluntary or mandatory smoke management programs for which records of prescribed burns on state and private lands are kept. Records including the scheduled date, extent (acres), and location (geographic coordinates or township/range/section) of large scale prescribed burns that occurred during the year 2002 on state and private lands in Minnesota and Arkansas were obtained from the Minnesota Interagency Fire Center and the Arkansas Forestry Commission, respectively. Also, the Louisiana Forestry Division provided summary data describing the dates and acreages of prescribed burns that occurred on Louisiana's state and private lands during the year 2002. This summary data listed burns by district and had to be allocated to the county level using the acreage of forested land within each county.

A statewide permitting system exists for all other planned burns in Minnesota, including small scale residential or agricultural burns. The permits are issued by local fire wardens, and an estimated 60,000 burn permits were issued in the state in 2002. Records of these permitted burns are not compiled above a county level and are not in electronic format. Of the 60,000 permits, roughly 65% are estimated to be issued for "ditch burns" (fires set alongside roads or fencerows for weed abatement purposes) or "pile burns" (fires used to dispose of piles of waste material). Ditch burns are generally less than one quarter mile in length and were not considered in the inventory due to their small size and the lack of specific data. Also, since pile burns are used for waste management purposes, they fall beyond the scope this inventory. The remaining 35% of the permitted burns are performed on open land and range and are likely to be captured by the agricultural survey (Meadows, 2004).

In Oklahoma, a 15-county area in the eastern portion of the state has a controlled burn authorization system for open burning on private lands and lands managed by the state forest service. Records containing the date, type (grassland, woodland, brush pile, etc.), extent (acres), and location (address) of prescribed burns that occurred in that region of Oklahoma during 2002 were obtained from the Oklahoma Forestry Service[5]. Oklahoma's Department of Wildlife Conservation (DWC) estimated the total number of acres burned on lands managed by the DWC in 2002, which accounted for the remainder of the state lands in Oklahoma that undergo substantial prescribed burning.

[5] About one-third of these records was provided in hard-copy format and were not included in the final inventory.

The Kansas State Fire Marshal's office keeps a database of fire incidents in Kansas as reported by local fire departments (although prescribed burns in Kansas may or may not be reported to the local fire departments, depending on the specific regulations within each township). The dates and locations (counties) of the controlled burns that were reported to the local fire departments in Kansas during 2002 were obtained from the Kansas State Fire Marshal's database.

In Texas, virtually all of the burning on state lands is conducted by the Texas Parks and Wildlife Department (TPWD) in state parks and Wildlife Management Areas (WMA). TPWD was able to provide data on burns occurring in state parks, but WMA burns are not tracked in a central database. Attempts to gather data from individual WMA managers were not successful, so the number of WMA acres burned in 2002 was estimated from data published by Allen and Dennis (2000) for 1996 and 1997.

Missouri, Iowa, and Nebraska have neither smoke management programs nor prescribed burn records compiled above the county level. The Forestry Section of the Missouri Department of Conservation summarized the number of acres burned by The Nature Conservancy, the Missouri Department of Natural Resources, and the Missouri Department of Conservation on state and private lands in Missouri during the year 2002. In the state of Iowa, the Bureau of Wildlife performs a large portion of the state's prescribed burns on public grasslands. However, records of the prescribed burns that occur on Iowa's conservation lands are not compiled by the Bureau of Wildlife above the dispatch level. Therefore, the percentage of federal lands burned in the state of Iowa during 2002 was used as a surrogate in order to estimate the total number of acres burned on Iowa's state lands. In Nebraska, a statewide burn ban requires prescribed burns to be permitted, but records of prescribed burn permits are not compiled above the county level. Therefore, the percentage of federal lands burned in the state of Nebraska in 2002 was used as a surrogate to estimate the total number of acres burned on state lands. The estimated acreage of state lands burned in Missouri, Iowa, and Nebraska will be allocated by county using the percentage of state lands in each county within each state.

To ensure that burning on tribal lands was captured in the data sources listed above; contacts were made to tribes that collectively hold over 95% of the tribal lands in the CENRAP region. It was confirmed that these tribes report their burns to either the BIA or the Minnesota Interagency Fire Center.

For burning on private land, it was assumed that burns by individual parties would be related to agricultural practices (and, therefore, captured in the agricultural survey data) or the burning of waste (and, therefore, not considered under the scope of this project). Significant burns on private lands are most likely to be conducted by the forest industry, or by organizations such as the Nature Conservancy (TNC), The Prairie Plains Institute, or the Platte River Whooping Crane Maintenance Trust (Whitney, 2003). We did not obtain specific data from all the aforementioned organizations due to time constraints, though the TNC provided a database of all burns conducted by that agency in 2002.

Planned burns by private forestry companies in Louisiana and Arkansas are largely included in the data received from the Louisiana Forestry Division and the Arkansas Forestry

Commission. Forestry companies also perform planned burns in the Piney Woods region of east Texas. However, records of the planned burns that occurred during 2002 were not available from the Texas Forest Service. Traditionally, the Texas Forest Service reported planned burning information in the Harvest Trends Report; yet, after 1999, the Harvest Trends Report ceased to include information about planned burning because the practice of planned burning for forest management has diminished in recent years due to liability concerns (Xu, 2004). In the absence of other information, data reported by Allen & Dennis (2000) on acres burned by private timber companies in the Piney Woods region for 1996 and 1997 were averaged to produce an estimate of 20,000 acres burned per year. These acres were allocated to the county level based on the forested acreage in each county that makes up the Piney Woods region.

3.3.3 Activity Data for Rangelands

Rangeland burning occurs extensively on private lands throughout the CENRAP states, particularly in Kansas, Nebraska, Oklahoma, and central and west Texas. To obtain activity data for rangeland burning events in the CENRAP region, the agricultural burning survey given to county AES offices included rangeland burning questions designed to determine the fraction of rangeland acreage typically burned each year and the timing of such burn events. The survey results (discussed in Section 2) yielded activity data for private lands for all of the CENRAP states. We obtained additional prescribed burning information for private lands in some of the CENRAP states, as previously discussed in Section 3.3.2.

3.4 SPATIAL ALLOCATION OF PRESCRIBED BURNING

Fire occurrence locations for prescribed burns were typically provided as point coordinates (i.e., latitude and longitude values), township/range assignments, or county name. While the size of the fire was typically provided (in acres), the actual boundaries of the prescribed burns were not usually provided. To represent the location and approximate size of each burn, the reported location of each burn was assumed to be the centroid of the burn and was mapped as a point using the latitude/longitude coordinates. County-specific vegetation profiles from the BELD data were then matched to each fire location to determine the vegetation types associated with each fire. The vegetation data (used by the FOFEM model), fire size, occurrence date, and associated fuel moisture data were used to calculate emissions for each fire.

While many of the prescribed burns were large, there were no fires larger than the 12-km x 12-km grid cell resolution. Therefore, when the locations of prescribed burns were known, they were treated as point sources in the emission inventory. Approximately 40% of the prescribed burning inventory was allocated spatially and temporally as a point source inventory. (States that were able to provide “incident-level” databases of prescribed burn activity included Arkansas, Minnesota, and Oklahoma.) When the locations of fires were not reported, a spatial surrogate approach was used to develop gridded spatial allocation factors.

Spatial allocation factors were used to spatially distribute emissions at the sub-county level (by grid cell). To develop gridded surrogate data, a surrogate data source is used to represent the locations of fire activity. Prescribed burns were spatially distributed on rural grasslands and forested lands, while agricultural burns were spatially distributed on agricultural

land by crop type based on data obtained from the agricultural burning surveys. The spatial allocation factors were developed for the 12-km $\times$ 12-km National RPO grid.

3.5 TEMPORAL ALLOCATION OF PRESCRIBED BURNING

Fire history data collected for prescribed burns on federal lands specifies the dates on which the burns began and ended. These data were used to generate state-specific temporal profiles to allocate emissions from prescribed burning to the proper months of the year and days of the week. Also, by examining the number of burns completed in one day versus those spanning multiple days (and therefore continuing through the night), it was possible to estimate the fraction of prescribed burning that takes place in daylight hours versus nighttime hours.

In the absence of date-specific information for prescribed burns on state lands, temporal profiles derived from federal prescribed burns were applied to burns on state lands.

3.6 CHEMICAL SPECIATION OF PRESCRIBED BURNING

PM and VOC emissions were chemically speciated according to profiles developed by the EPA and the CARB. **Tables 3-1 and 3-2** summarize the profile references and the individual compounds included in two profiles: (1) prescribed burning of grasslands and (2) prescribed burning of woodlands. Using these references, we created speciation profiles and cross-reference files according to SMOKE speciation schemes.

Table 3-1. Chemical speciation of prescribed burns: profile information for grasslands.

Profile Name	Profile Number	Profile Source	Source Category SCC Code	SCC Description	Reference	Proposed Classification Schemes	Individual Compounds
PM							
Range Improvement Burning	441	ARB	CARB SCC Code 67066402000000 (assumed to correspond to EPA SCC Code 2810020000)	Waste Burning – Range Management – Range Improvement	(Jenkins et al., 1996)	Default SMOKE classification scheme and individual compounds	Aluminum, Ammonia, Antimony, Arsenic, Barium, Bromine, Cadmium, Calcium, Elemental Carbon, Organic Carbon, Chlorine, Chromium, Cobalt, Copper, Gallium, Gold, Indium, Iron, Lanthanum, Lead, Manganese, Mercury, Molybdenum, Nickel, Nitrates, Palladium, Phosphorous, Potassium, Rubidium, Selenium, Silicon, Silver, Sodium, Strontium, Sulfur, Thallium, Tin, Titanium, Uranium, Vanadium, Yttrium, Zinc, Zirconium, Unidentified
NMHC

4. AIR QUALITY DATA ANALYSIS

The objective of data analysis for this project was to preliminarily assess whether planned burning appears to contribute to impaired visibility events in Class I areas. We used existing ambient pollutant data from Class I areas in conjunction with the planned burn emission inventories developed through this project. To meet this objective, we performed the following steps:

- Summarized 2002 air quality data available for Class I areas in the CENRAP region (e.g., IMPROVE[f] speciated $PM_{2.5}$ data). Smoke components that contribute to visibility impairment include organic carbon (OC) and elemental carbon (EC).
- Identified where and when planned, prescribed, and/or agricultural burns occurred near and/or upwind of Class I areas in 2002 by using the Task 1 emission inventory.
- Characterized the ambient data for the 20% best and 20% worst visibility days at the Class I areas, including the average composition of the $PM_{2.5}$ and the average contribution of pollutants to light extinction. Determined whether any of these days coincide with burns included in the inventory.
- Investigated the ambient data for days with high concentrations of or contributions from EC and non-soil potassium (associated with biomass burning). Investigated seasonal patterns and whether any of these days coincide with burns listed in the inventory.
- Analyzed days of interest in more detail by performing trajectory analyses, inspecting satellite photos, and investigating existing hourly pollutant data (e.g., whether nephelometer measurements indicate the impact of air parcels with increased $PM_{2.5}$ concentrations).

The deliverable for this task is a technical memorandum describing the analyses and summarizing analysis results. A discussion of the analysis and results is also included in the project Final Report.

[f] IMPROVE = Interagency Monitoring of Protected Visual Environments

5. PREPARATION OF DIGITAL EMISSION INVENTORY FILE SYSTEMS

The following files will be delivered by STI upon completion of the planned burning emission inventory with accompanying documentation:

- Emission data files in latest NIF format
- Emission data files converted to IDA format and ready for input to SMOKE 1.5
- Temporal profile and cross-reference files for use by SMOKE
- Spatial surrogate and cross-reference files for use by SMOKE
- Chemical speciation profiles and cross-reference files for use by SMOKE

APPENDIX A

PROPOSED SURVEY QUESTIONNAIRE

This page is intentionally blank.

Central States Regional Air Planning Association (CENRAP)
Telephone Interview
Project #1002

INTRO1: Hello, my name is __________. I'm calling on behalf of the Central States Regional Air Planning Association or CENRAP. CENRAP is an organization of states, tribes, federal agencies, and other interested parties that studies and addresses regional haze and visibility issues. Your state is participating in CENRAP and as such, your county has been randomly selected to participate in an important air quality study.

Q1a. Our records show that this is a cooperative agricultural extension office in _________ county in the state of ________. Is that correct?

[1] Yes	(Go to Qa2)
[2] No	(Go to Q1b)
[8] DON'T KNOW	(Terminate)
[9] REFUSED	(Terminate)

Q1b. What office have I called? ____ (Go to Q2a)

Q2a. I would like to speak with the person who would be most knowledgeable about your county's tilling practices and agricultural burning practices.

[1] I am that person	(Go to INTRO3a)
[2] I am that person, but I only know tilling	(Go to INTRO3a)
[3] I am that person, but I only know about burning	(Go to Q3a)
[4] I'll get him/her	(Go to INTRO2)
[5] No one is available now	(Go to CALLBACK)
[6] No such person	(Terminate)
[8] DON'T KNOW	(Terminate)
[9] REFUSED	(Terminate)

INTRO2: Hello, my name is __________. I'm calling on behalf of the Central States Regional Air Planning Association or CENRAP. CENRAP is an organization of states, tribes, federal agencies, and other interested parties that studies and addresses regional haze and visibility issues. Your state is participating in CENRAP and as such, your county has been randomly selected to participate in an important air quality study (Go to Q2b).

Q2b. Are you the person who is most knowledgeable about your county's tilling practices and agricultural burning practices.

[1] I am that person	(Go to INTRO3a)
[2] I am that person, but I only know tilling	(Go to INTRO3a)
[3] I am that person, but I only know about burning	(Go to Q3a)
[8] DON'T KNOW	(Terminate)
[9] REFUSED	(Terminate)

INTRO3a: The interview will take about 10 minutes. Your responses will be kept confidential and will not be connected to your name. Can I begin the interview? <Go to Q3a1>

Q3a. What agency or agencies would have information about tilling practices in your county? (Probe: Is that a state or county agency?) Can I get their telephone number as well?

1. ____
2. ____

777 = NOT APPLICABLE
888 = DON'T KNOW
999 = REFUSED

<Go to INTRO3b>

INTRO3b: The interview will take about 10 minutes. Your responses will be kept confidential and will not be connected to your name. Can I begin the interview? <Go to Q3a1>

CALLBACK: When would be a good time for us to call back to talk with someone about agricultural burning in your county? Who should we ask for? <Interviewer Note: If told you have reached the incorrect agency, ask for correct agency name and telephone number>

TERMINATE: Thank you for your time. Goodbye.

<If Q1a Eq 2, go to Q3a2. If Q1a Eq 1, go to Q3a1>

Q3a1. What is the name of this office? ______________________________

88888 = DON'T KNOW
9999 = REFUSED

Q3a2. What is your name? ______________________________

8888 = DON'T KNOW
9999 = REFUSED

Q3a3. What is your telephone number beginning with the area code? ( ) __________

8888888 = DON'T KNOW
9999999 = REFUSED

Q3b. I'm now going to read you a list of crops and I'd like you to tell me whether these crops are grown in your county? (Programmer note: 1 data output column only; Yes=1, No=2)

1. Corn _____
2. Wheat _____
3. Sorghum _____
4. Rice _____
5. Other cereal crops _____
6. Soybeans _____
7. Sugarcane _____
8. Hay or alfalfa _____
9. Cotton _____
10. Other crops not previously mentioned _____
11. Grazed rangelands _____

8 = DON'T KNOW
9 = REFUSED

<If Q2a or Q2b Eq 1 or 2, go to Q4. If Q2a or Q2b Eq 3, go to Q14>

Agricultural Dust Questions

<Note: Show selected crop names from Q3b for Questions #4 through #12 with the exception of showing Q3b11. Only show Q3b11 for questions #14 through #19>

Q4. How many plantings of each crop type are normally completed during a year? Let's start with (name of 1st crop). Typically, how many plantings per year are made for (name of 1st crop)? How about for (name of 2nd crop)? For (name of 3rd crop)? Read list of remaining selected crops.

a. Corn _____
b. Wheat _____
c. Sorghum _____
d. Rice _____
e. Other cereal crops _____
f. Soybeans _____
g. Sugarcane _____
h. Hay or alfalfa _____
i. Cotton _____
j. Other crops not previously mentioned _____

88 = DON'T KNOW
99 = REFUSED

Q5. In your county, are tilling passes typically made on each crop before planting and after harvesting or are harvesting and planting completed in one pass? Let's start with (name of 1st crop). Typically, when are tilling passes made for (name of 1st crop)? Is it before planting and after harvesting or is tilling completed in one pass? How about for (name of 2nd crop)? Read list of remaining selected crops.

1 = Yes, passes are made before planting and after harvesting
2 = Tilling passes are completed at the same time
88 = DON'T KNOW
99 = REFUSED

	Passes
a. Corn	_____
b. Wheat	_____
c. Sorghum	_____
d. Rice	_____
e. Other cereal crops	_____
f. Soybeans	_____
g. Sugarcane	_____
h. Hay or alfalfa	_____
i. Cotton	_____
j. Other crops not previously mentioned	_____

<If Q5a through Q5j Eq 2, 8, or 9, go to Q6. If Q5a through Q5j Eq 1, go to Q7>

Q6. How many tilling passes are typically made on each crop in your county? Let's start with (name of 1st crop). Typically, how many tilling passes are made for (name of 1st crop)? How about for (name of 2nd crop)? Read list of remaining selected crops.

	Passes
a. Corn	_____
b. Wheat	_____
c. Sorghum	_____
d. Rice	_____
e. Other cereal crops	_____
f. Soybeans	_____
g. Sugarcane	_____
h. Hay or alfalfa	_____
i. Cotton	_____
j. Other crops not previously mentioned	_____

88 = DON'T KNOW
99 = REFUSED

<Go to Q8>

Q7. How many tilling passes are typically made on each crop before planting and after harvesting in your county? Let's start with (name of 1st crop). Typically, how many passes are made for (name of 1st crop) before planting? How about for (name of 2nd crop)? Read list of remaining selected crops.

Let's now turn to harvesting. Typically, how many passes are made for (name of 1st crop) after harvesting? For (name of 2nd crop)? Read list of remaining selected crops.

	1. Planting	2. Harvesting
a. Corn	_____	_____
b. Wheat	_____	_____
c. Sorghum	_____	_____
d. Rice	_____	_____
e. Other cereal crops	_____	_____
f. Soybeans	_____	_____
g. Sugarcane	_____	_____
h. Hay or alfalfa	_____	_____
i. Cotton	_____	_____
j. Other crops not previously mentioned	_____	_____

88 = DON'T KNOW
99 = REFUSED

Q8. Do farmers use any special tilling practices such a no-till, low-till, ridge-till, or mulch-till farming in your county? Let's start with (name of 1st crop), are no-till, low-till, ridge-till, or mulch-till tilling practices typically used for this crop?

What about for (name of 2nd crop)? Are no-till, low-till, ridge-till, or mulch-till practices typically used for this crop? Read list of remaining selected crops.

(Yes=1, No=2)

	1. No-till	2. Low-till	3. Ridge-till	4. Mulch-till
a. Corn	_____	_____	_____	_____
b. Wheat	_____	_____	_____	_____
c. Sorghum	_____	_____	_____	_____
d. Rice	_____	_____	_____	_____
e. Other cereal crops	_____	_____	_____	_____
f. Soybeans	_____	_____	_____	_____
g. Sugarcane	_____	_____	_____	_____
h. Hay or alfalfa	_____	_____	_____	_____
i. Cotton	_____	_____	_____	_____
j. Other types of crop not previously mentioned	_____	_____	_____	_____

8 = DON'T KNOW
9 = REFUSED

<If Q5a through Q5j Eq 2, 8, or 9, go to Q10. If Q5a through Q5j Eq 1, go to Q9>

Q9. For each crop, please tell me how many days before planting and after harvesting does tilling typically occur in your county. Let's start with (name of 1st crop). Typically, how many days before planting does tilling occur for (name of 1st crop)? How about for (name of 2nd crop)? Read list of remaining selected crops.

Let's now turn to harvesting. Typically, how many days after harvesting does tilling occur for (name of 1st crop)? For (name of 2rd crop)? Read list of remaining selected crops.

	1. Before Planting	2. After Harvesting
a. Corn	_____	_____
b. Wheat	_____	_____
c. Sorghum	_____	_____
d. Rice	_____	_____
e. Other cereal crops	_____	_____
f. Soybeans	_____	_____
g. Sugarcane	_____	_____
h. Hay or alfalfa	_____	_____
i. Cotton	_____	_____
j. Other crops not previously mentioned	_____	_____

888 = DON'T KNOW
999 = REFUSED

Q10. For each crop, please tell me whether tilling usually occurs on weekdays, weekends, or both weekdays and weekends? (Programmer note: 1 data output column only; Weekdays=1, Weekends=2, Both=3)

a. Corn	_____
b. Wheat	_____
c. Sorghum	_____
d. Rice	_____
e. Other cereal crops	_____
f. Soybeans	_____
g. Sugarcane	_____
h. Hay or alfalfa	_____
i. Cotton	_____
j. Other crops not previously mentioned	_____

8 = DON'T KNOW
9 = REFUSED

Q11. For each crop, please tell me whether tilling usually occurs during daytime, nightime, or both daytime and nighttime hours? (Programmer note: 1 data output column only; Daytime=1, Nightime=2, Both=3)

a.	Corn	_____
b.	Wheat	_____
c.	Sorghum	_____
d.	Rice	_____
e.	Other cereal crops	_____
f.	Soybeans	_____
g.	Sugarcane	_____
h.	Hay or alfalfa	_____
i.	Cotton	_____
j.	Other crops not previously mentioned	_____

8 = DON'T KNOW
9 = REFUSED

<If Q11a through Q11j Eq 3 go to Q12. If Q11a through Q11j Eq 1, 2, 8, or, 9 go to Q13>

Q12. For each crop, please tell me what percent of tilling occurs during daytime and nighttime hours? Let's start with (name of first crop). What percent of tilling for this crop occurs in the daytime and what percent occurs in the nighttime?

		1. % Daytime	2. % Nighttime
a.	Corn	_____	_____
b.	Wheat	_____	_____
c.	Sorghum	_____	_____
d.	Rice	_____	_____
e.	Other cereal crops	_____	_____
f.	Soybeans	_____	_____
g.	Sugarcane	_____	_____
h.	Hay or alfalfa	_____	_____
i.	Cotton	_____	_____
j.	Other crops not previously mentioned	_____	_____

888 = DON'T KNOW
999 = REFUSED

<NOTE: For Q12a1 through Q12j2, daytime % and nighttime % must add to 100% or question must be re-asked>

<If Q2a or Q2b Eq 2, go to Q13>
<If Q2a or Q2b Eq 1, go to Q14>

Q13. What agency should I contact concerning agricultural burning in your county? (Probe: Is that a state or county agency?) Can I get the telephone number as well?

a. ____
b. ____

888 = DON'T KNOW
999 = REFUSED

<Go to THANK YOU>

Agricultural Burning Questions

<Note: Show selected crop names from Q3b for Questions #14 through #19>

Q14. For each crop, what percent of the total acreage is typically burned each year in your county? Let's start with (name of 1st crop). What percent of (name of 1st crop) is burned each year? Read list of remaining selected crops.

a.	Corn	_____ %
b.	Wheat	_____ %
c.	Sorghum	_____ %
d.	Rice	_____ %
e.	Other cereal crops	_____ %
f.	Soybeans	_____ %
g.	Sugarcane	_____ %
h.	Hay or alfalfa	_____ %
i.	Cotton	_____ %
j.	Other crops not previously mentioned	_____ %
k.	Grazed rangelands	_____ %

888 = DON'T KNOW
999 = REFUSED

Q15. For each crop, please tell me how many days before planting and after harvesting does agricultural burning typically occur in your county. Let's start with (name of 1st crop). Typically, how many days before planting does agricultural burning occur for (name of 1st crop)? How about for (name of 2nd crop)? Read list of remaining selected crops.

Let's now turn to harvesting. Typically, how many days after harvesting does agricultural burning occur for (name of 1st crop)? For (name of 2rd crop)? Read list of remaining selected crops.

		1. Before Planting	2. After Harvesting
a.	Corn	_____	_____
b.	Wheat	_____	_____
c.	Sorghum	_____	_____
d.	Rice	_____	_____
e.	Other cereal crops	_____	_____
f.	Soybeans	_____	_____
g.	Sugarcane	_____	_____
h.	Hay or alfalfa	_____	_____
i.	Cotton	_____	_____
j.	Other crops not previously mentioned	_____	_____
k.	Grazed rangelands	_____	_____

888 = DON'T KNOW
999 = REFUSED

Q16. For each crop, please tell me whether agricultural burning usually occurs during weekdays, weekends, or both weekdays and weekends? (Programmer note: 1 data output column only; Weekdays=1, Weekends=2, Both=3)

a. Corn	_____
b. Wheat	_____
c. Sorghum	_____
d. Rice	_____
e. Other cereal crops	_____
f. Soybeans	_____
g. Sugarcane	_____
h. Hay or alfalfa	_____
i. Cotton	_____
j. Other crops not previously mentioned	_____
k. Grazed rangelands	_____

8 = DON'T KNOW
9 = REFUSED

Q17. For each crop, please tell me whether crop residue is typically burned in your county during daytime, nightime, or both daytime and nighttime hours? (Programmer note: 1 data output column only; Daytime=1, Nightime=2, Both=3)

a. Corn	_____
b. Wheat	_____
c. Sorghum	_____
d. Rice	_____
e. Other cereal crops	_____
f. Soybeans	_____
g. Sugarcane	_____
h. Hay or alfalfa	_____
i. Cotton	_____
j. Other crops not previously mentioned	_____
k. Grazed rangelands	_____

8 = DON'T KNOW
9 = REFUSED

<If Q17 Eq 3, go to Q18. If Q17 Eq 1, 2, 8, or 9, go to Q19>

Q18. For each crop, please tell me what percent of crop residue is burned during daytime and nighttime hours?   Let's start with (name of first crop). What percent of crop residue burning for this crop occurs in the daytime and what percent occurs in the nighttime?

	1. % Daytime	2. % Nighttime
a. Corn	_____	_____
b. Wheat	_____	_____
c. Sorghum	_____	_____
d. Rice	_____	_____
e. Other cereal crops	_____	_____
f. Soybeans	_____	_____
g. Sugarcane	_____	_____
h. Hay or alfalfa	_____	_____
i. Cotton	_____	_____
j. Other crops not previously mentioned	_____	_____
k. Grazed rangelands	_____	_____

888 = DON'T KNOW
999 = REFUSED

<NOTE: For Q18a1 through Q18k2, daytime % and nighttime % must add to 100% or question must be re-asked>

Q19. For the following crops, please tell me whether headfires, backfires, or both types of fires are used. Headfires are burning in the direction of the wind and backfires are burning in a direction opposite to the wind. (Programmer note: 1 data output column only; Headfire=1, Backfire=2, Both=3)

a. Hay or alfalfa _____
b. Soybeans _____
c. Wheat _____

8 = DON'T KNOW
9 = REFUSED

Q20. What agency or agencies regulate agricultural burning in your county? (Probe: Is that a state or county agency?) Can I get the telephone number as well?

a. ____
b. ____

888 = DON'T KNOW
999 = REFUSED

<Go to THANK YOU>

<u>THANK YOU</u>: Those are all the questions. Thank you for your time. Goodbye.

APPENDIX C

ASSESSMENT OF INFLUENCE FROM PRESCRIBED BURNING ON CLASS I SITES USING AMBIENT SPECIATED $PM_{2.5}$ DATA

C.1 OBJECTIVE AND APPROACH

The objective of this task was to use ambient speciated $PM_{2.5}$ data from Class I areas (from the IMPROVE network) in the CENRAP states along with the planned burning emissions estimated in this study to assess whether ambient data can be used to identify planned burning contributions to visibility events in Class I areas, and to perform a preliminary assessment of the impact of planned burns on $PM_{2.5}$ and visibility The following approach was employed:

- Assess the seasonal chemical compositions of $PM_{2.5}$ mass and aerosol light extinction in order to determine what individual species are important to the mass and visibility extinction in the area.
- Determine seasonal concentrations of and ratios between selected species, such as OC, EC and K, to establish a "baseline" average seasonal composition for comparison to days of poor visibility and days potentially influenced by prescribed burning.
- Assess chemical compositions of $PM_{2.5}$ and aerosol light extinction on the 20% best and 20% worst visibility days to determine what species have a large impact on visibility (i.e., are species from burning typically important in visibility reduction?).
- Analyze IMPROVE data, specifically OC, EC, and K concentrations, on dates when extensive burning occurred nearby a monitoring site in order to assess whether wood smoke influences are seen in the ambient measurements and significantly impacts visibility.
- Analyze emissions data on days when elevated OC, EC and K concentrations occurred at IMPROVE sites in order to determine whether days of elevated concentrations corresponded to known burns in the emission inventory data.
- Analyze air mass trajectories on selected days to determine whether meteorology (i.e., transport) explains the observed effects and to determine the extent to which meteorology affects haze

C.2 AMBIENT MONITORING DATA

We analyzed ambient monitoring data from IMPROVE stations in order to assess the potential effect of prescribed burning emissions on visibility in the CENRAP region. We used ambient data from two IMPROVE stations located in Arkansas, Caney Creek (CACR1) and Upper Buffalo Wilderness (UPBU1). At the time of analysis, these sites were located in the area with the highest resolved fire histories, which would allow the best chance of showing direct influence between prescribed burning and ambient Class 1 data. **Figure C-1** shows the locations of IMPROVE stations in the CENRAP region, along with the point locations of prescribed burns that were available from the 2002 emissions inventory.

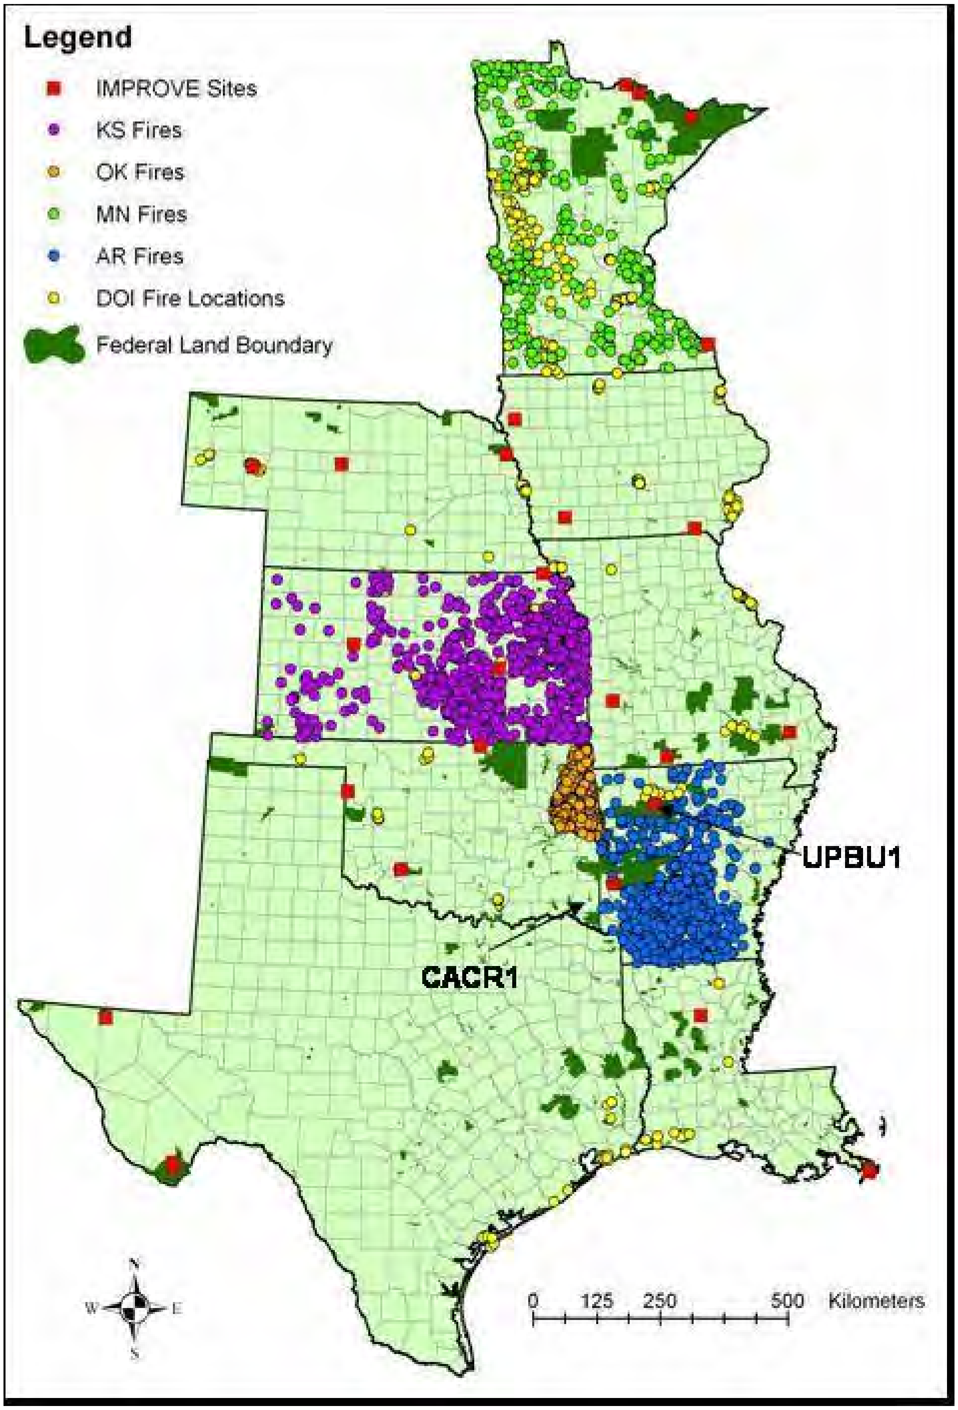

Figure C-1. IMPROVE station and fire locations.

We acquired data from the two ambient monitoring stations from the online IMPROVE database (http://vista.cira.colostate.edu/improve/). Specifically, we obtained values of all available parameters for the years 2000, 2001, and 2002, during which years the IMPROVE network collected 24-hr samples once every three days. Although the emissions inventory included fires only from 2002, IMPROVE data from all three years were used to ensure a robust

statistical analysis of seasonal and annual aerosol compositions and species ratios. **Table C-1** summarizes the number of complete samples that we obtained from the IMPROVE database for 2000 through 2002 and for 2002 alone. The complete samples were cases in which all key species in our analysis were available: elemental carbon (EC), organic carbon (OC), potassium (K), ammonium nitrate (NH_4NO_3), and ammonium sulfate ($(NH_4)_2SO_4$).

Table C-1. Number of complete samples available from 2000–2002 and from 2002 at Caney Creek and Upper Buffalo Wilderness.

Site	N samples (2000 – 2002)	N samples (2002)
Caney Creek	254	110
Upper Buffalo Wilderness	318	117

In analyzing the ambient monitoring data with respect to fire activity data, we focused on species that generally characterize fine particulate aerosols and species that derive from wood smoke: elemental carbon (EC), organic carbon mass (OCM), ammonium nitrate (NH_4NO_3), ammonium sulfate ($(NH_4)_2SO_4$), potassium (K), non-soil potassium (KNS), and a composite of species that derive from soils (GEO). Several of the parameters were calculated from measured values according to IMPROVE protocol, as summarized in **Table C-2**.

Table C-2. IMPROVE algorithms for mass concentrations of fine aerosol species.

Species	Abbreviation	IMPROVE Calculation
Organic Carbon Mass	OCM	1.4*[organic carbon]
Ammonium Nitrate	NH_4NO_3	1.29*[nitrate]
Ammonium Sulfate	$(NH_4)_2SO_4$	4.125*[sulfur]
Non-soil Potassium	KNS	[potassium]-0.6*[iron]
Soil Elements	Soil	2.20*[aluminum]+2.49*[silicon]+1.63*[calcium] +2.42*[iron]+1.94*[titanium]

The IMPROVE algorithm for OCM adjusts the measured OC value for other elements associated with carbon molecules, such as oxygen and hydrogen, and it relies on the assumption that the average organic molecule contains 70% carbon. The ammonium nitrate and ammonium sulfate algorithms assume that nitrate and sulfate ions are fully neutralized by NH_4^+. The ammonium sulfate algorithm also assumes that all elemental sulfur is in the form of sulfate, and it converts the mass of elemental sulfur to ammonium sulfate using 4.125, which is the ratio of the molecular weight of ammonium sulfate (132 g/mol) to the molecular weight of elemental sulfur (32 g/mol). Similarly, the ammonium nitrate algorithm multiplies the nitrate concentration by the ratio (1.29) of the molecular weight of ammonium nitrate (80 g/mol) to the molecular weight of nitrate (62 g/mol). The non-soil potassium (KNS) algorithm results from the observed ratio (0.6) of potassium to iron in soils. The residual, non-soil potassium (KNS) is assumed to derive from smoke. Lastly, the soil algorithm includes the sum of soil-derived elements, adjusted by coefficients that account for their normal oxides.

The IMPROVE network utilizes the measured mass concentrations of OCM, EC, $(NH_4)_2SO_4$, NH_4NO_3, and soil components to estimate the light extinction resulting from each species. Light extinction values associated with the individual species are summed to reconstruct an overall aerosol extinction parameter (b_{ext}). The IMPROVE extinction calculations account for scattering, absorption, and the effects of relative humidity, as illustrated by equations listed in **Table C-3**. The coefficients represent the dry scattering efficiencies of the compounds, except the coefficient for the EC algorithm, which represents the light absorbing efficiency of EC. $F_T(RH)$ equals an empirically determined relative humidity correction factor that accounts for the hygroscopic nature of the ionic aerosol species.

Table C-3. IMPROVE algorithms for light extinctions of fine aerosol species.

Species	Abbreviation	IMPROVE Calculation
Organic Carbon Mass	OCM Extinction	4*[organic carbon]
Ammonium Nitrate	NH_4NO_3 Extinction	3*F_T(RH)*[nitrate]
Ammonium Sulfate	$(NH_4)_2SO_4$ Extinction	3*F_T(RH)*[sulfur]
Elemental Carbon	EC Extinction	10*[elemental carbon]
Soil Elements	Soil Extinction	1*[Soil]

C.3 DATA VALIDATION

Data validation helps to prevent serious errors in data analysis and modeling results by identifying erroneous individual data values. The $PM_{2.5}$ Data Analysis Workbook contains the guidelines that we employ for PM data validation (Main and Roberts, 2001). The validation incorporates internal consistency checks of ambient monitoring data, such as the comparison of species concentrations using scatter plots, the calculation of reconstructed particulate mass, and the preparation of material balances. Scatter plots that illustrate the relationships between well characterized species enable data analysts to quickly inspect data and identify any suspect points that may require further attention. Scatter plots also provide a general overview of a data set and preliminary data analysis. Plots that compare species from common sources, such as soil, or from different analytical techniques, such as ion chromatography (IC) or x-ray fluorescence (XRF), can target outlying data points that may indicate an unusual event or an equipment problem. Plots between reconstructed mass and measured mass or between cations and anions help the analyst to visually assess data completeness and to validate data resulting from different measurement techniques. We generated a number of scatter plots using SYSTAT statistical software in an effort to validate the IMPROVE data before performing the comparative analysis. **Table C-4** summarizes the species we inspected using scatter plots, along with their expected relationships and typical sources.

The data quality was good, as IMPROVE data is quality controlled prior to being incorporated into the database; thus, minimal effort was required. The data validation plots explored include 2000 through 2002 data for both Caney Creek and Upper Buffalo Wilderness. The data from both sites exhibit similar relationships between measured species. **Figure C-2** illustrates the comparison between sulfur (S) and sulfate (SO_4^{-2}) for the data set from Upper Buffalo Wilderness. A relatively tight correlation and a slope of roughly three indicate a good

Table C-4. Scatter plot species and expected relationships.

Species	Species	Expected Relationship	Source or Reason
S	SO_4^{-2}	$3*S \sim SO_4^{-2}$	IC vs. XRF
Cl ion	Cl	~ 1:1	IC vs. XRF
Na ion	Na	~ 1:1	IC vs. XRF
K ion	K	~ 1:1	IC vs. XRF
Na	Cl	Correlation	Sea salt
Ca	Si	Correlation	Soil
Al	Si	Correlation	Soil
Fe	Si	Correlation	Soil
Fe	K	Correlation	Soil
OC	Total Carbon (TC)	Correlation	OC large part of TC
EC	TC	Some Correlation	EC part of TC
Se	SO_4^{-2}	Some Correlation	Coal Emissions
Fe	Zn	Some Correlation	Smelter Emissions
Ni	V	Some Correlation	Oil Combustion
K	EC	Some Correlation	Wood Smoke
b_{abs}	EC	Correlation	EC absorbs most light
Cations	Anions	Near 1:1	Neutralized Aerosol
$PM_{2.5}$	Reconstructed Mass	Good Correlation	Should be equal

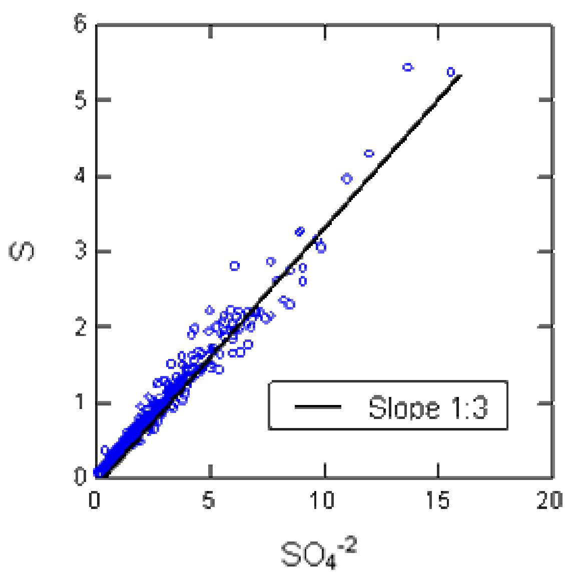

Figure C-2. Concentrations of XRF sulfur (S) versus IC sulfate (SO_4^{-2}) from the Upper Buffalo Wilderness IMPROVE station (µg/m^3). The line has a slope of one third, representing the expected 1:3 ratio between sulfur and sulfate.

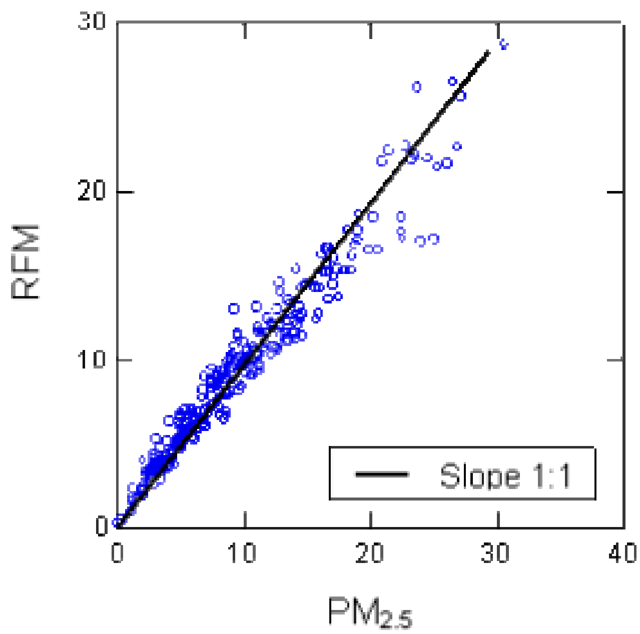
comparison between the data obtained from the XRF and IC analyses. The slope equals 3 because the molecular mass of sulfate (96 g/mol) is three times the molecular mass of sulfur (32 g/mol). **Figure C-3** highlights the good correlation between the measured fine particulate mass ($PM_{2.5}$) and the reconstructed fine particulate mass (RFM). According to IMPROVE protocol, RFM equals the sum of SO_4^{-2}, NO_3^-, EC, OCM, and soil components. The good correlation between $PM_{2.5}$ and RFM indicates the overall reliability of the data sets and measurement techniques. The correlation exhibited between iron (Fe) and potassium (K) in **Figure C-4** is confounded by several data points of high K and low Fe, which suggests an additional source of K, possibly wood smoke, since both species commonly derive from soils. Overall this indicates that most K is from soil, which suggests influence from the non-soil sources is infrequent and contributes only a small amount of the



K.

Figure C-3. Concentrations of reconstructed fine mass (RFM) versus fine particulate mass ($PM_{2.5}$) from the Caney Creek IMPROVE station ($\mu g/m^3$). The line has a slope of one, representing a one to one ratio between RFM and $PM_{2.5}$.

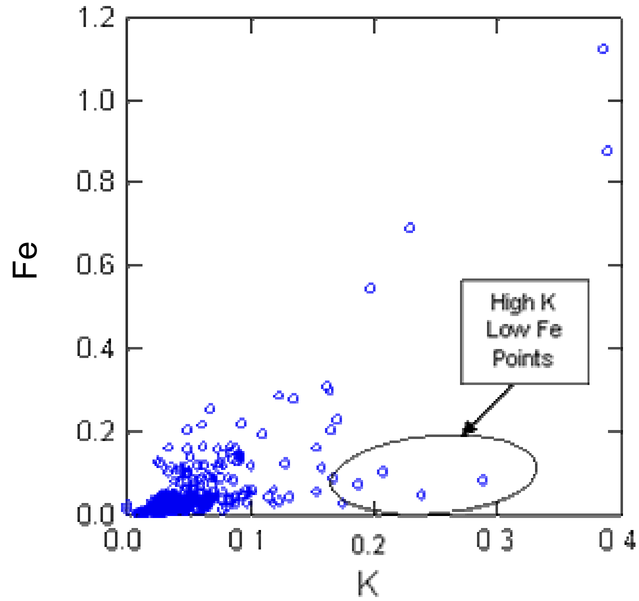


Figure C-4. Concentrations of iron (Fe) versus potassium (K) from the Upper Buffalo Wilderness IMPROVE station (µg/m^3). Points that exhibit higher than normal K to Fe ratios are highlighted.

C.4 CHARACTERIZING $PM_{2.5}$ DATA

It is important to first characterize the typical seasonal concentrations of and ratios between species to understand what comprises the "normal" composition of $PM_{2.5}$ before identifying whether specific source influences such as prescribed burning can be determined. **Figure C-5** depicts seasonal proportions of the median mass concentrations of OCM, EC, NH_4NO_3, $(NH_4)_2SO_4$, and soil influences for Caney Creek; Upper Buffalo Wilderness showed similar results. Summary statistics are given in Appendix A. At both sites, $(NH_4)_2SO_4$ and OCM comprise the dominant fractions of $PM_{2.5}$ in all seasons except winter, when NH_4NO_3 also contributes a significant fraction. The larger fraction of NH_4NO_3 in winter is consistent with nitrate formation mechanisms which favor cold, wet conditions, and the dominant fractions of $(NH_4)_2SO_4$ are consistent with observations made at other eastern IMPROVE sites (Malm, 1999). EC is a small component of the mass in all seasons.

Figure C-6 illustrates the proportions of light extinction attributed to OCM, EC, NH_4NO_3, $(NH_4)_2SO_4$, and soil for each season at Caney Creek; Upper Buffalo Wilderness showed similar results. Summary statistics are given in Appendix A. The dominant portion of light extinction derives from $(NH_4)_2SO_4$ in all seasons except winter, when NH_4NO_3 also contributes significantly. This is consistent with other analyses of $PM_{2.5}$ aerosol in the Midwest and CENRAP region (http://www2.nature.nps.gov/air/studies/bravo/bravo2003factsheet.htm)

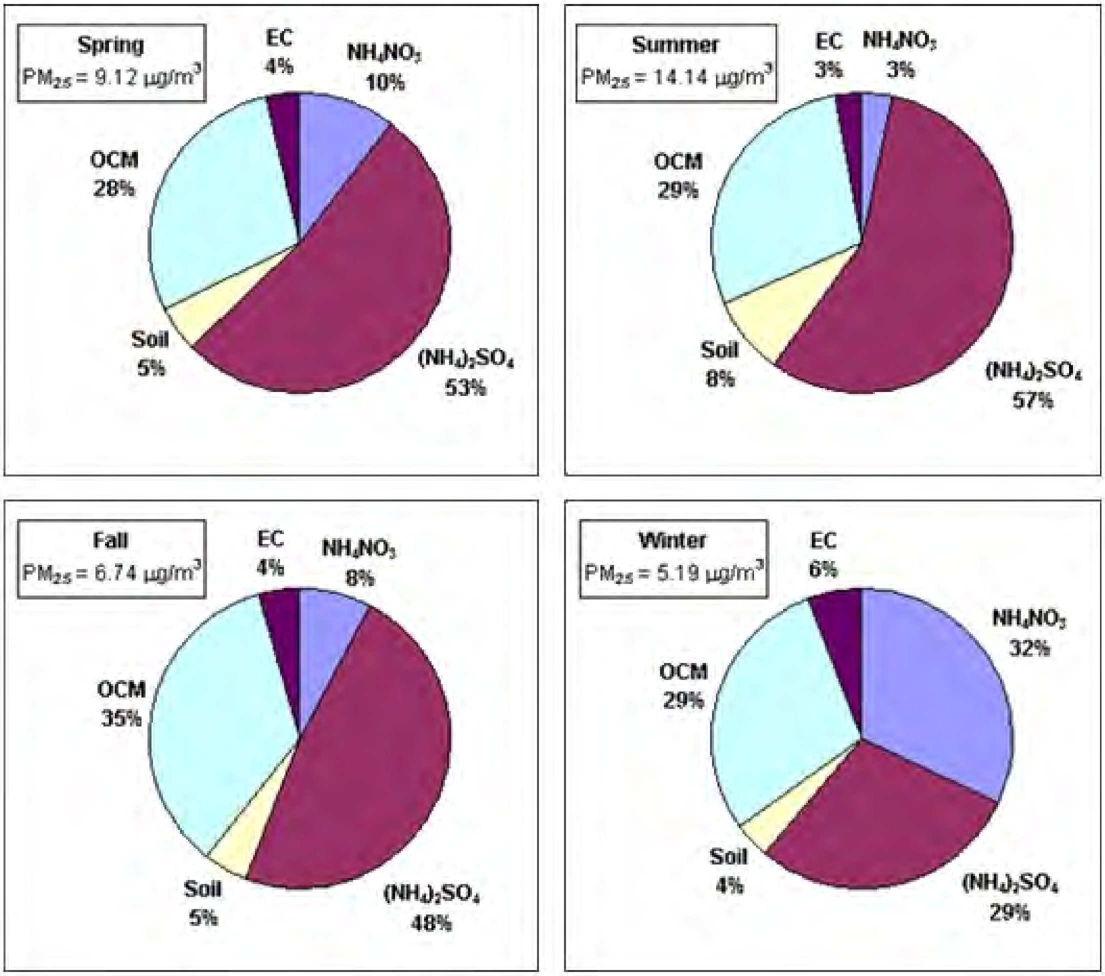

Figure C-5. Median mass and composition of $PM_{2.5}$ by season (spring is March to May, summer is June to August, fall is September to November, and winter is December to February) at Caney Creek for 2000 through 2002.

(Coutant et al., 2003; Coutant et al., 2002; Georgoulias and Dattner, 2002; Sisler and Malm, 2000; Malm, 1999). $PM_{2.5}$ composition at other Class 1 areas in the CENRAP region will likely be similar. The light extinction proportions resemble the mass concentration proportions, because the extinction calculations directly depend on mass concentrations. $(NH_4)_2SO_4$ has a large effect on visibility due to its extremely hygroscopic nature and large contribution to the overall mass. The effect of EC on visibility is most pronounced during the winter months when the effect of $(NH_4)_2SO_4$ is at a minimum, though it only accounts for about 5% of the total extinction.

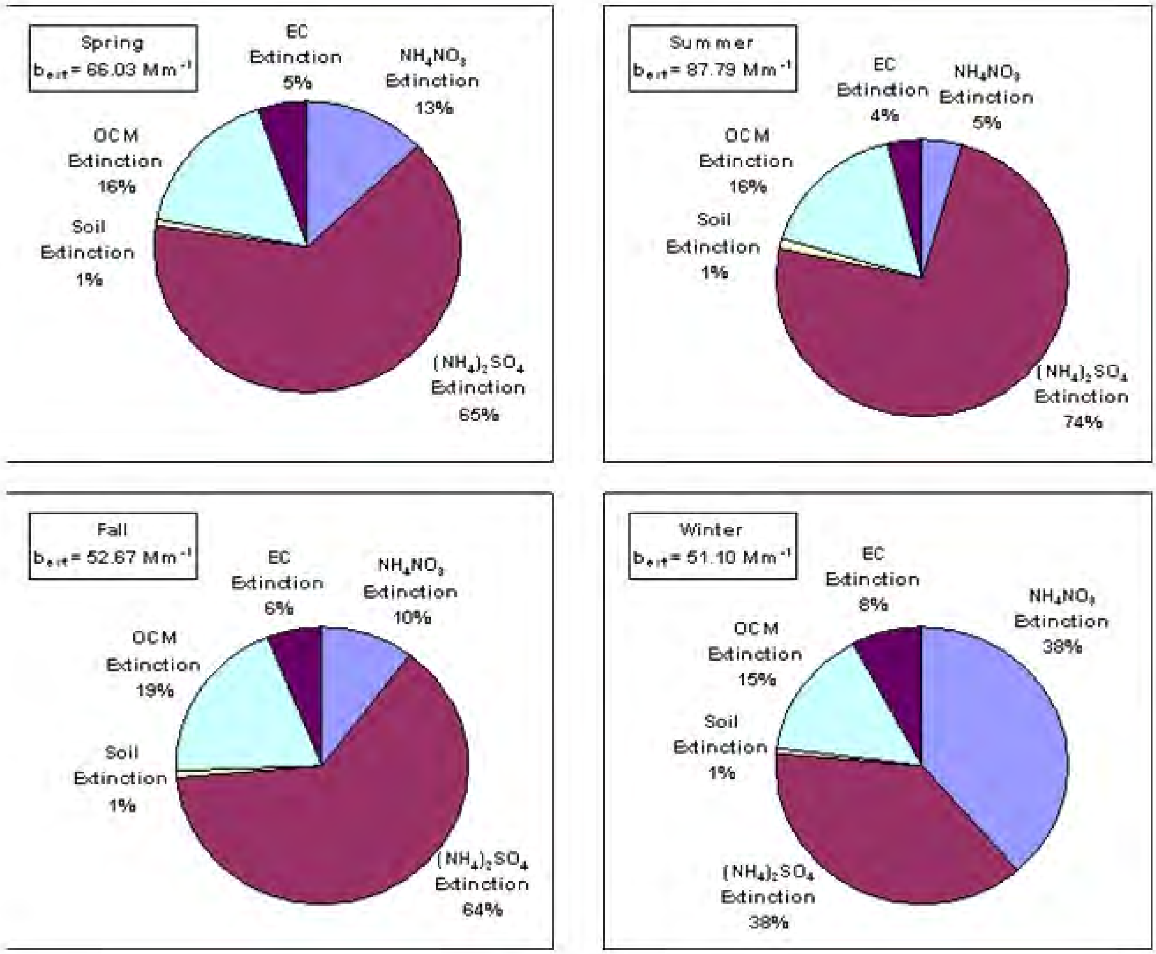

Figure C-6. Median extinction and composition of extinction by season (spring is March to May, summer is June to August, fall is September to November, and winter is December to February) at Caney Creek for 2000 through 2002.

C.5 CHARACTERIZATION OF VISIBILITY

In order to determine which species are most responsible for poor visibility, we isolated the top and bottom 20% visibility days in 2000 through 2002 by aerosol extinction at each site. Summary statistics of the best visibility data, worst visibility data, and overall data for Caney Creek and Upper Buffalo Wilderness were calculated. The median mass compositions for the best and worst visibility days, as well as the annual median from Caney Creek are depicted in **Figure C-7**; results for Upper Buffalo Wilderness are similar to those for Caney Creek. At both sites, days with poor visibility are dominated by $(NH_4)_2SO_4$ and show a decrease in the fractions of the other species, especially OCM and NH_4NO_3. The fractions of EC and Soil components vary to a lesser extent between the good visibility and poor visibility days and are minor contributors to mass and extinction.

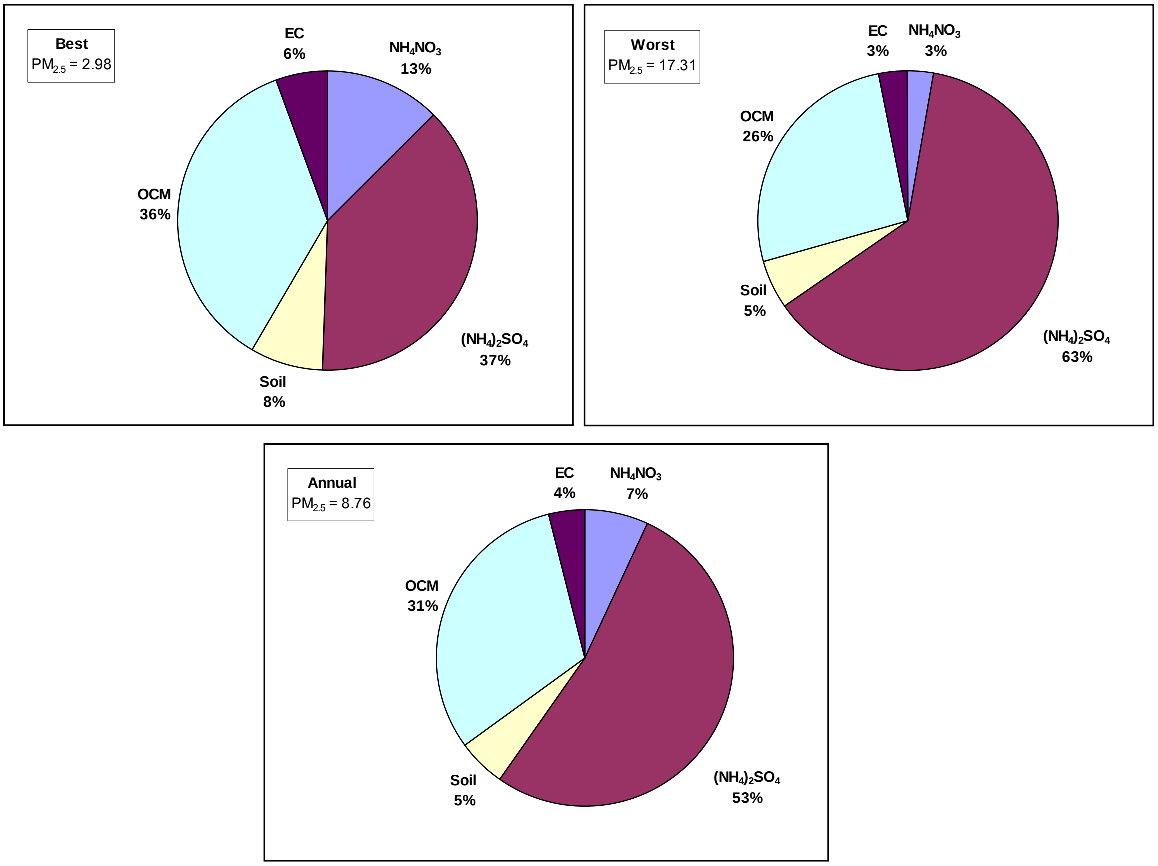

Figure C-7. Median $PM_{2.5}$ composition for the 20% best and worst aerosol extinction days and the median annual composition at Caney Creek from 2000 to 2002.

C.6 FIRE HISTORY DATA

In order to evaluate the effect of prescribed fires on visibility, we analyzed fire history data with the 2002 IMPROVE data for Caney Creek and Upper Buffalo Wilderness. We isolated the dates with IMPROVE data that corresponded to the day of or the day after prescribed burning occurred within a specific radius (i.e., range of influence) of each site. The range of influence around each site was established by using data from nearby meteorological stations: the radius around each site was calculated as the sum of the 24 hourly averaged wind speeds for each date, which represented an estimate of the distance that a parcel of air could have traveled on a given day. Theoretically, emissions from fires located within the range of influence could have been detected by the IMPROVE station if transport conditions were conducive. We then analyzed dates when the most extensive burning (with respect to acreage) occurred.

Due to the proximity of the two IMPROVE sites, several of the dates selected for each site overlap. The OCM, EC, K and KNS mass concentrations from overlapping dates that correspond to the day of or the day after extensive burning within the vicinity of both sites are compared to the springtime and annual mean concentrations from 2000 to 2002 for each site in **Figures C-8** and **C-9**. Error bars representing the 95% confidence limits for the mean concentrations of EC and KNS for the springtime and annual data sets are also plotted. In

Appendix A, mass concentrations of EC, KNS and the other key species for the selected dates and whether the EC and KNS concentrations significantly exceed the springtime are presented.

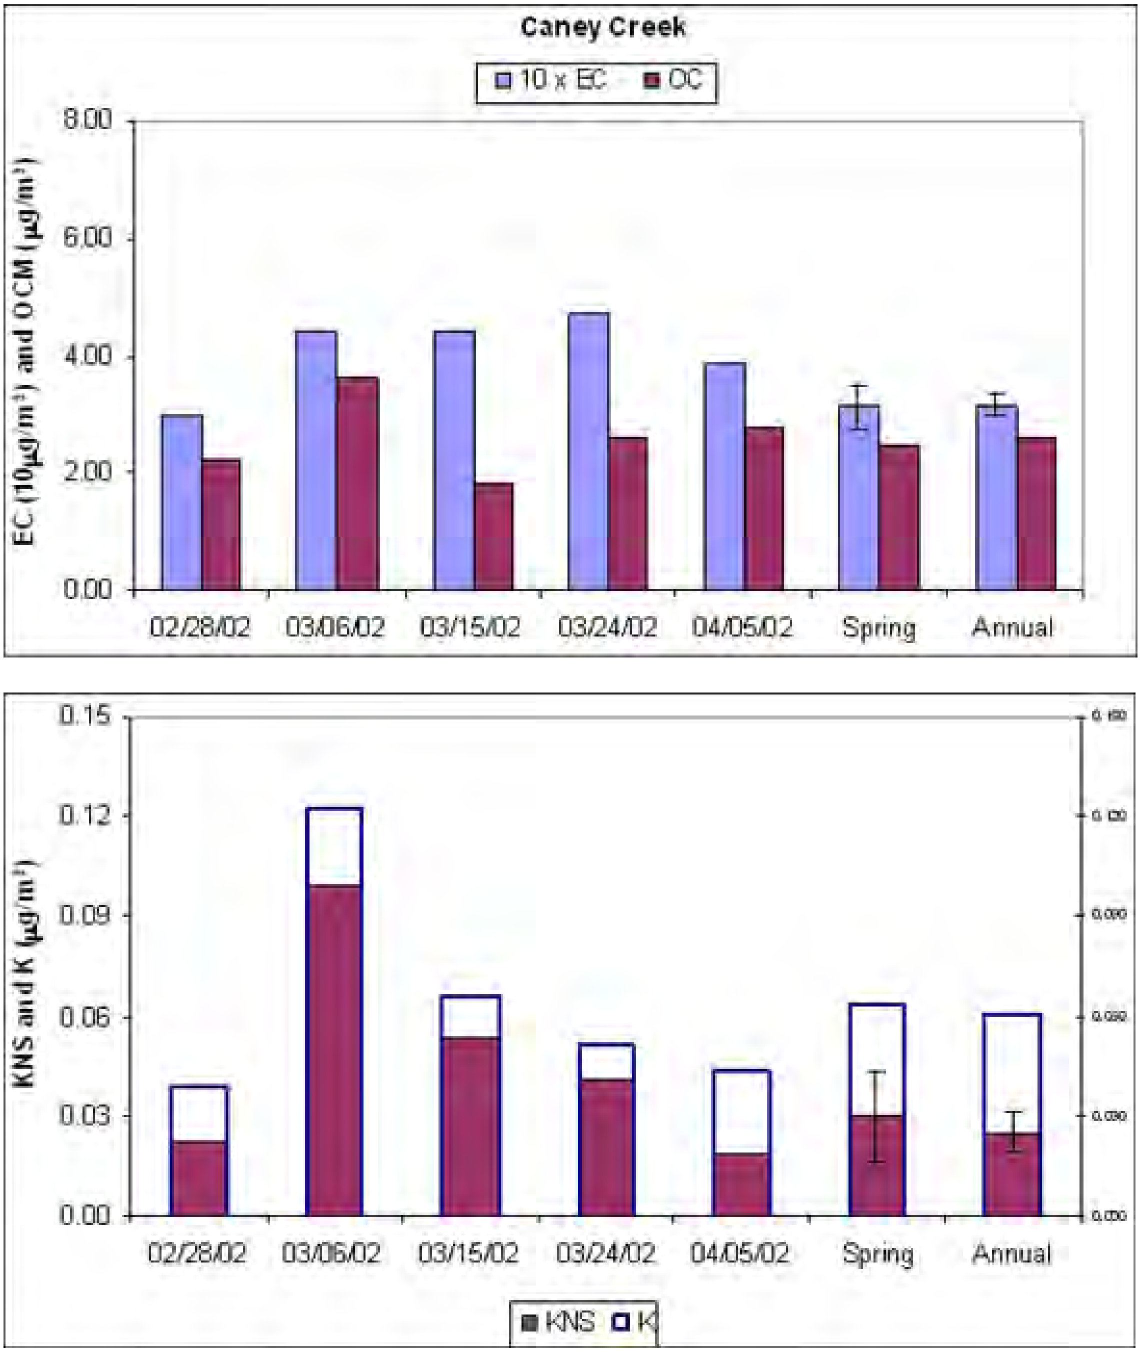

Figure C-8. EC, OCM, K and KNS mass concentrations (μg/m^3) for select dates compared to the spring and annual means for Caney Creek.

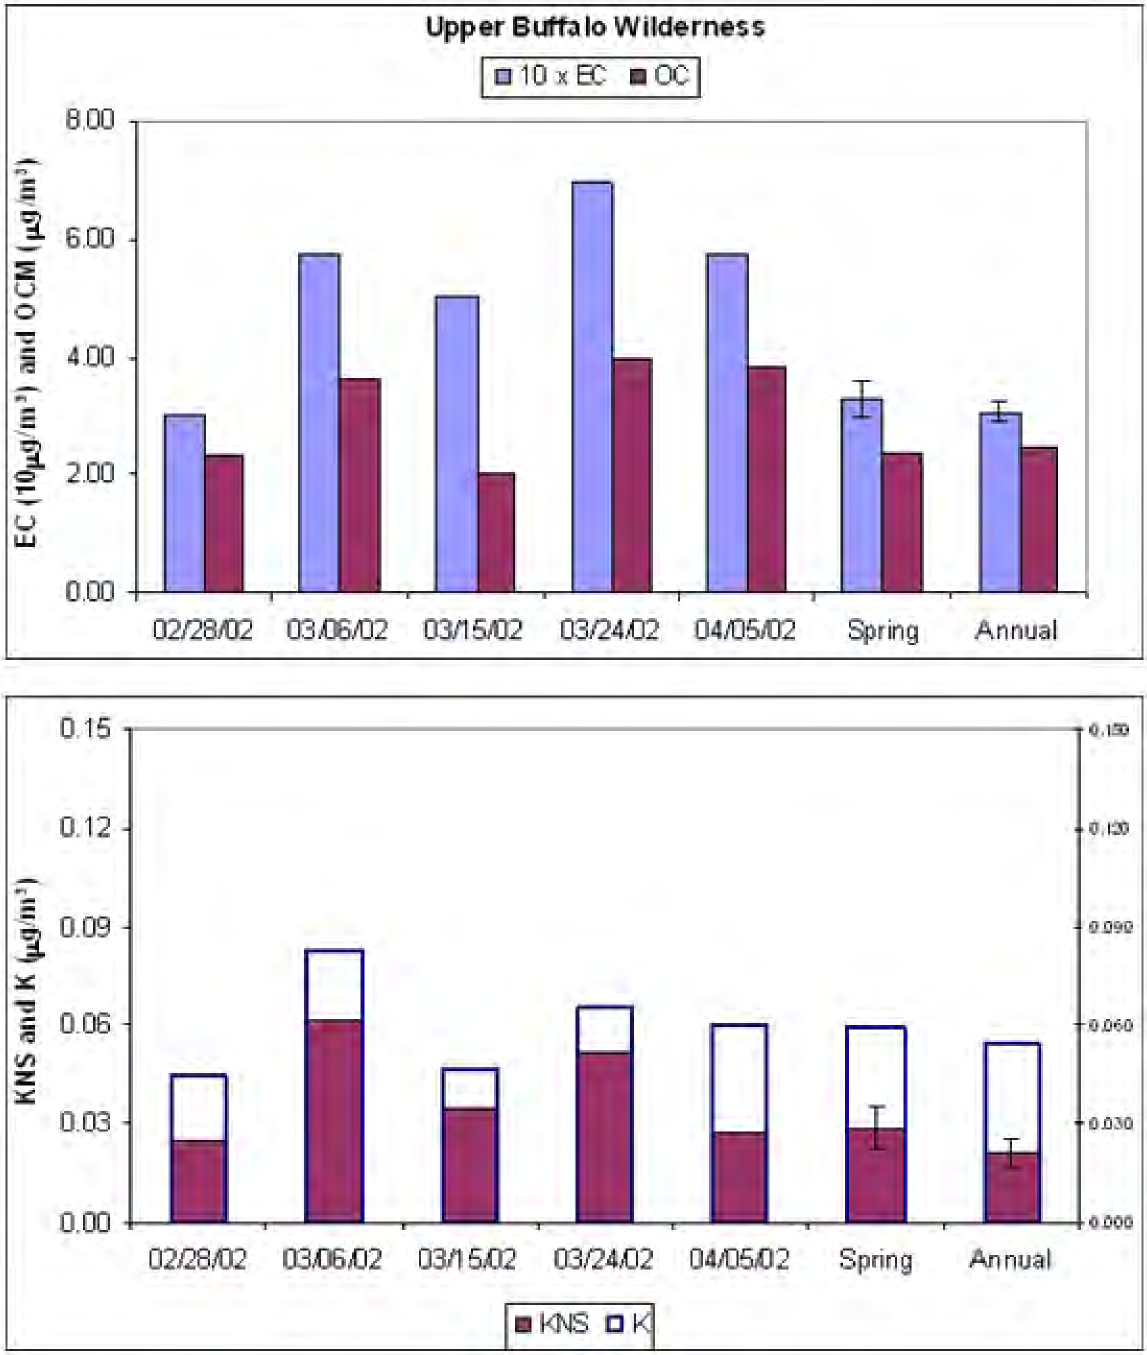

Figure C-9. EC and KNS mass concentrations (μg/m^3) for select dates compared to the spring and annual means for Upper Buffalo Wilderness.

Extensive burns occurred on the days before March 6, 15, 24, and April 5. On these dates, the measured EC significantly (at a 95% confidence level) exceeds the springtime and annual means for both sites. On March 15 and 24, the contributions of EC in relation to OC are significantly higher than the springtime and annual average EC contributions for both sites. The elevated EC emissions observed on March 6, 15, 24, and April 5 could derive from the extensive

burning that occurred on the previous days, if transport conditions were correct. Extensive burning occurred on February 28, but the EC measurements fell below the springtime and annual means at both sites, although not statistically significant at a 95% confidence level. On March 6, 15, and 24, the KNS mass concentrations exceeded the mean springtime and annual KNS concentrations for both sites, and the relative contribution of KNS in comparison to K is also higher on these dates. The elevated KNS also suggests influence from wood burning on these days. Air mass trajectories were run to further investigate the potential influence of prescribed burns on ambient measurements, as discussed in Section C.9.

Figure C-10 compares the mass concentration ratios of EC to OCM and of KNS to K for the selected dates to the annual median ratios. The KNS to K ratios from March 6, 15, and 24 clearly exceed the annual ratio, indicating a relatively large contribution of KNS during these dates. Since KNS largely derives from wood smoke, emissions from nearby burns likely influenced the IMPROVE sites. The EC to OCM ratio from March 15 also clearly exceeds the annual ratio, further suggesting fire influence on this day.

C.7 DO HIGH CONCENTRATIONS OCCUR ON DAYS OF PRESCRIBED BURNS?

In addition to isolating the dates associated with extensive burning from the fire history data and analyzing corresponding ambient measurements, we also isolated the dates with high mass concentrations from the ambient measurements and analyzed corresponding fire history data. For each site, we ranked the 2002 IMPROVE data by the mass concentrations of EC, OCM, KNS, and K. We summarized the selected dates, ranks of each compound, whether a fire occurred, and the total acres burned within the sphere of influence of each site in **Tables C-5** and **C-6**.

At both sites, the dates of higher EC and OCM mass concentrations overlap more with each other than with the dates of higher K mass concentrations, as EC and OCM both commonly derive from combustion sources and K derives largely from soils. At Upper Buffalo Wilderness, three of the five highest EC mass concentrations were measured on the dates that we had isolated during the previous analysis of fire occurrence, namely March 6, 24, and April 5. Since EC partly derives from wood smoke and extensive burns occurred on the day of and the day before these dates, the elevated EC emissions could derive from nearby prescribed burns. We further analyze the potential connection between elevated emissions of key species and fire occurrence in the next section, utilizing air mass trajectories for select dates.

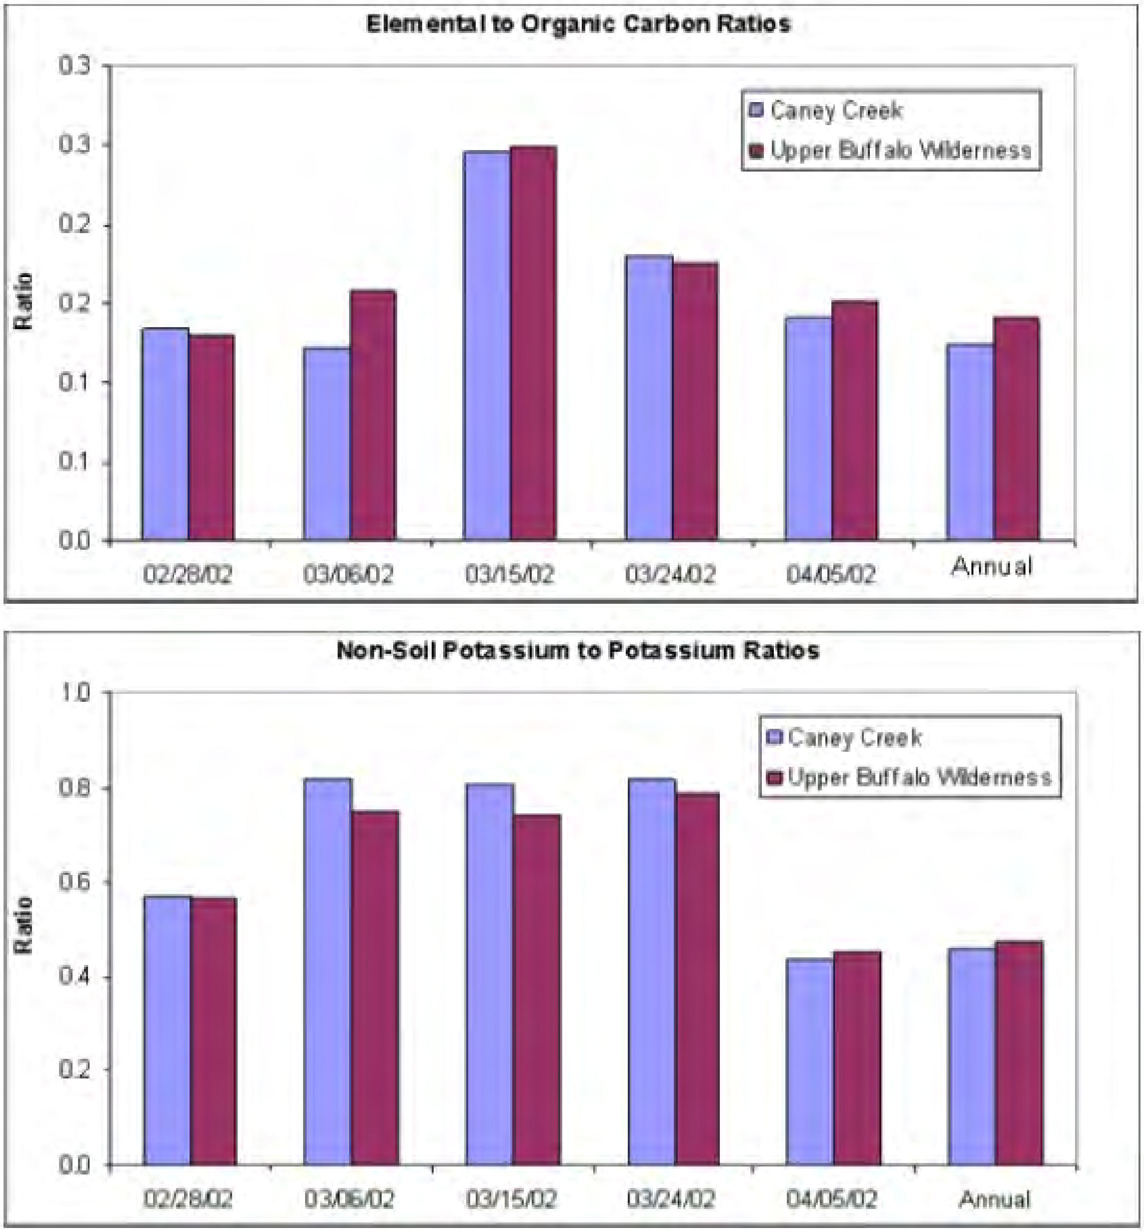

Figure C-10. EC to OCM and KNS to K mass concentration ratios for select dates compared to the annual median ratios for both sites

Table C-5. Dates with high measured EC, OCM, KNS and K mass concentrations and total acres burned within the sphere of influence of Caney Creek. The ranks order the days according to the five highest measured mass concentrations of each species.

Date	EC Rank	OCM Rank	KNS Rank	K Rank	Day of or before fires?	Total Acres
01/17/02	2				Of and Before	4,618
03/06/02			5		Of and Before	19,509

C.8 AIR MASS TRAJECTORIES

Back trajectories of air masses for the selected dates were created using the National Oceanic and Atmospheric Administration (NOAA) Hybrid Single-Particle Lagrangian Integrated Trajectory (HYSPLIT) model. The NOAA HYSPLIT model is a three-dimensional air mass trajectory model based on weather model data and can be obtained from the NOAA web site at http://www.arl.noaa.gov/ready/hysplit4.html. The final (FNL) product of the Global Data Assimilation System (GDAS) that uses the Global Spectral Medium Range Forecast (MRF) model provides the weather data for the HYSPLIT model. The HYSPLIT model uses National Weather Service soundings and other diagnostic parameters such as temperature, relative humidity and radiative and momentum fluxes. It uses a 129 x 129 polar stereograph (three-dimensional) grid, with approximately 190 km resolution and 12 vertical layers, and is run at 6-hour increments. Back trajectories were run from 1800 CST with ending heights of 1000 and 500 meters in order to capture short-range transport in the lower boundary layer.

We ran trajectories for March 6, 15, and 24 and plotted them along with fires that occurred the day of and the day before the selected dates. **Figures C-11 through C-13** show the maps for March 6, 15, and 24. On these dates, the EC and KNS mass concentrations exceeded the annual means for each site, as summarized in Figure C-9.

Air mass trajectories demonstrated no influence from known burns at the Caney Creek site on March 6. However, the inventory does not include detailed fire history data for the southeastern corner of Oklahoma or for the eastern portion of Texas, over which the air mass advected before reaching the site. On approach to the Upper Buffalo Wilderness site, the air did pass directly over extensive fires that occurred on March 5. Therefore, the elevated EC and KNS emissions measured at Upper Buffalo Wilderness on March 6 could derive from wood smoke emissions from the previous day that influenced the site over a 24 hour period. Additionally, there were numerous nearby fires to Caney Creek on March 5 and 6 that would have affected the site via flow below 500 meters.

Similar to the situation on March 6, the air flowed directly over burns reported in the emissions inventory before reaching Upper Buffalo Wilderness on March 15, but the air did not flow over the reported burns when approaching Caney Creek. The elevated EC and KNS emissions measured at Upper Buffalo Wilderness on March 15 could be attributed to the wood smoke emissions from the extensive March 14 burns, and detailed fire history data from neighboring states would allow more definitive conclusions to be drawn about the measurements from Caney Creek. Also, the similarity in $PM_{2.5}$ composition at the two sites on this day indicates they were influenced from similar sources, again suggesting local low level flow advecting smoke to Caney Creek that is not shown by the trajectories.

Finally, on March 24, the air approaching Caney Creek circumvented the extensive fires reported by the inventory, while the air approaching Upper Buffalo Wilderness passed directly over them. Once again, the higher than average EC and KNS mass concentrations observed on March 24 at Upper Buffalo Wilderness could have originated from prescribed burning emissions, while more information would support definitive conclusions as to the Caney Creek emissions. Overall, the $PM_{2.5}$ composition and air mass trajectories show that fire influence from large-scale burns can be seen in the ambient data at Caney Creek and Upper Buffalo Wilderness. More

extensive emission inventory data is needed to better assess the impact of prescribed burn emissions in the CENRAP region.

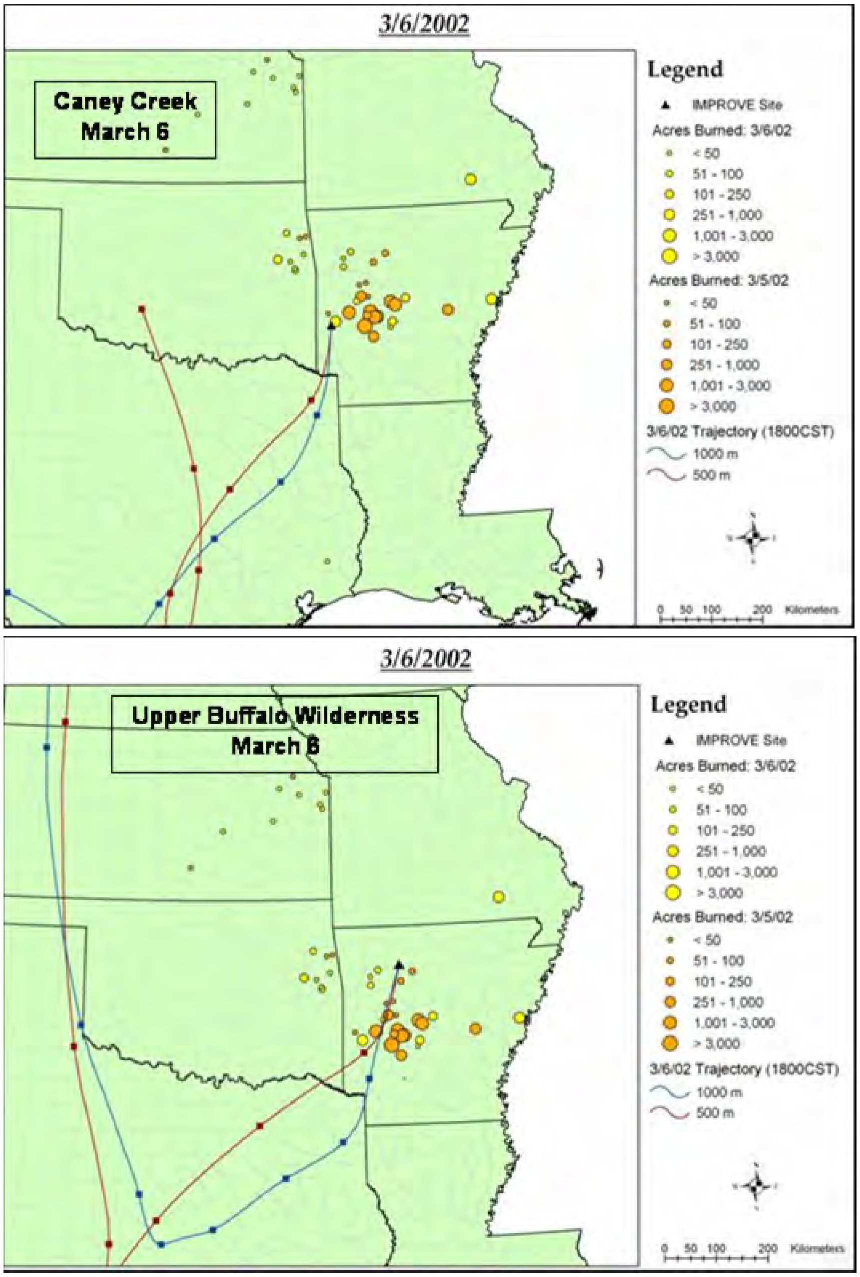

Figure C-11. Air mass trajectories and associated fires for March 6. Squares along each trajectory are placed every 6 hours.

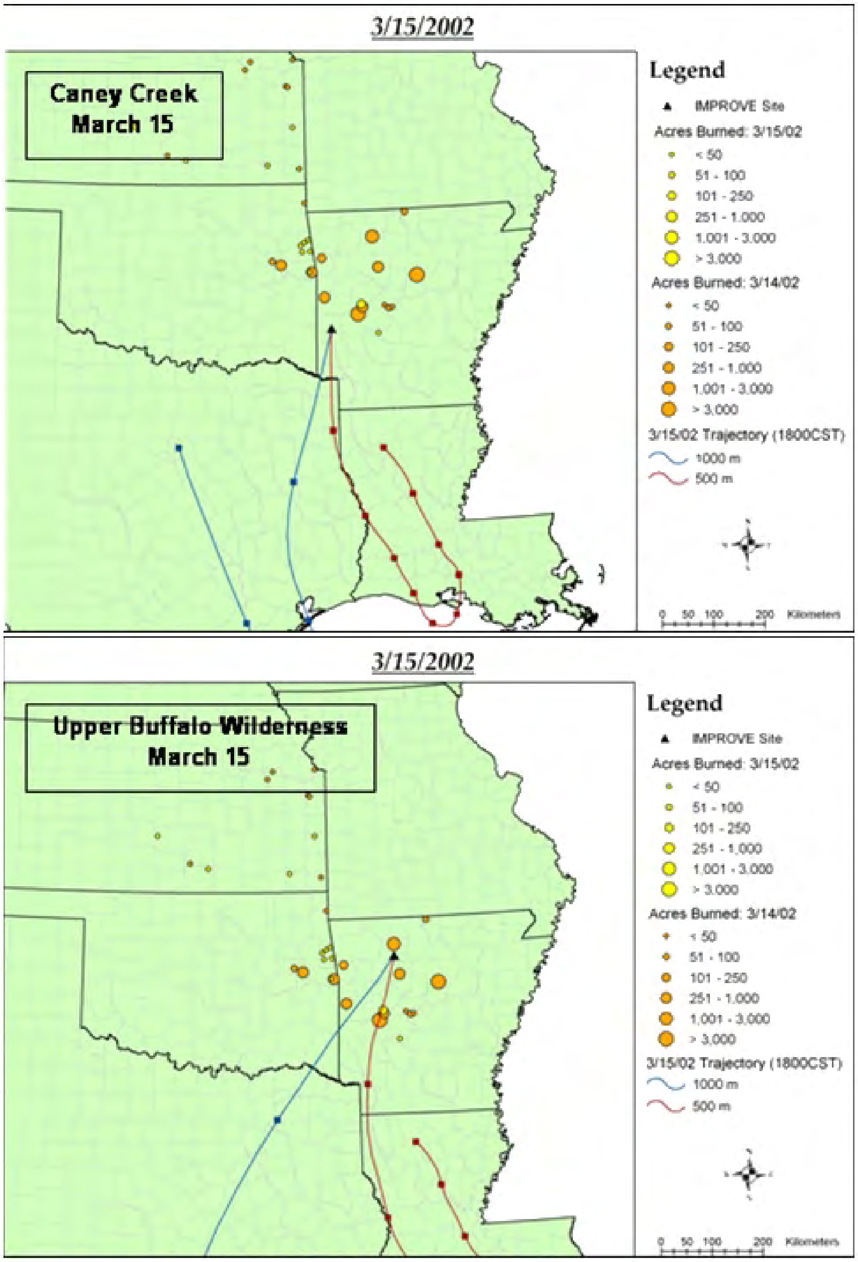

Figure C-12. Air mass trajectories and associated fires for March 15. Squares along each trajectory are placed every 6 hours.

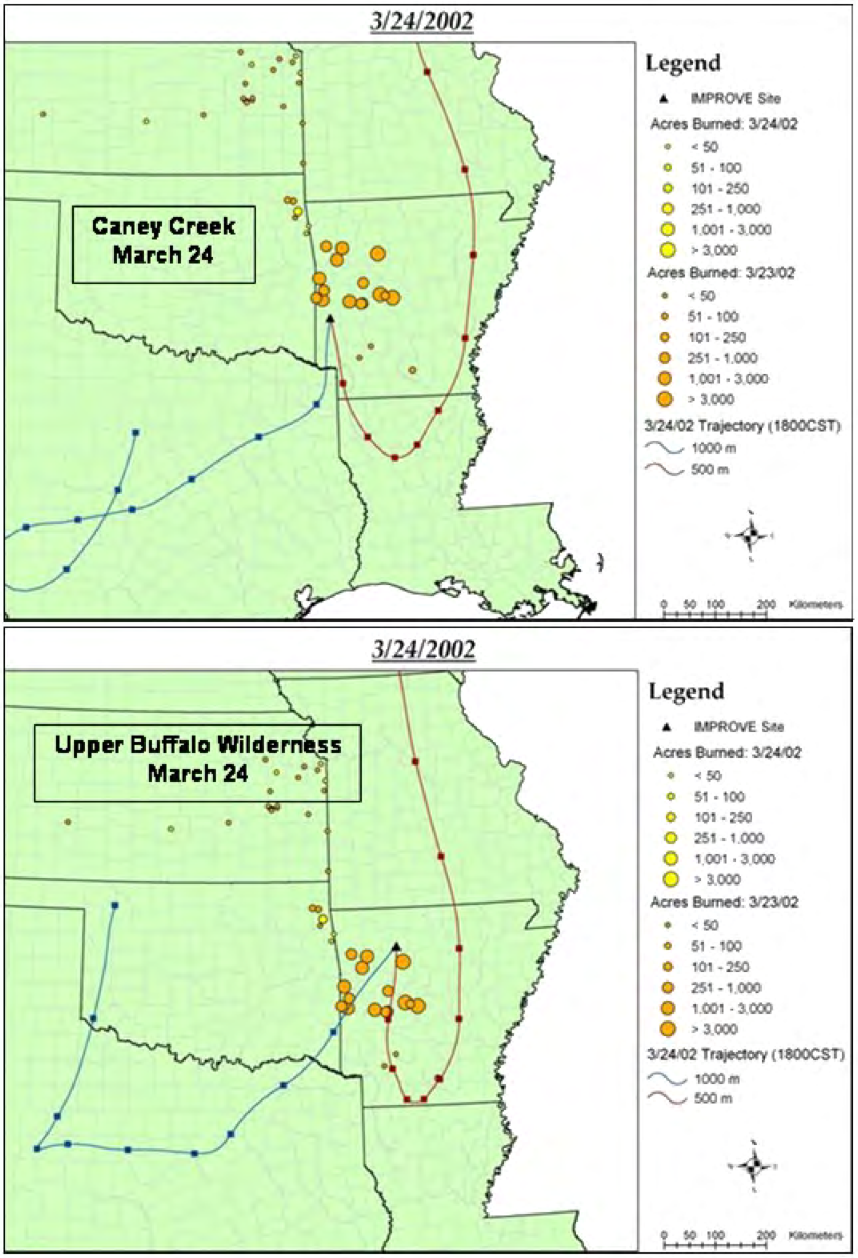

Figure C-13. Air mass trajectories and associated fires for March 15. Squares along each trajectory are placed every 6 hours.

C.9 EFFECTS ON VISIBILITY

We have demonstrated a potential connection between prescribed burn occurrence and elevated EC and KNS emissions at Upper Buffalo Wilderness via comparative analyses of ambient data and fire history data and air mass trajectories. In order to assess the impact that the elevated emissions have on visibility, we plotted the median $PM_{2.5}$ mass compositions of the annual, best visibility, and worst visibility data sets from Upper Buffalo Wilderness in order to

compare them to the mass and visibility compositions measured on the select dates March 6, 15, and 24, as illustrated in **Figure C-14**. The $PM_{2.5}$ mass compositions consist of the measured NH_4NO_3, $(NH_4)_2SO_4$, soil elements, OCM, and EC mass concentrations. The worst visibility data set is characterized by high $(NH_4)_2SO_4$ and OCM measurements, while the best visibility data set is characterized by relatively low concentrations of all the species. Since $(NH_4)_2SO_4$ does not derive from wood smoke, and OCM can derive from other sources, the species that dominate poor visibility conditions are not necessarily connected with emissions from wood smoke.

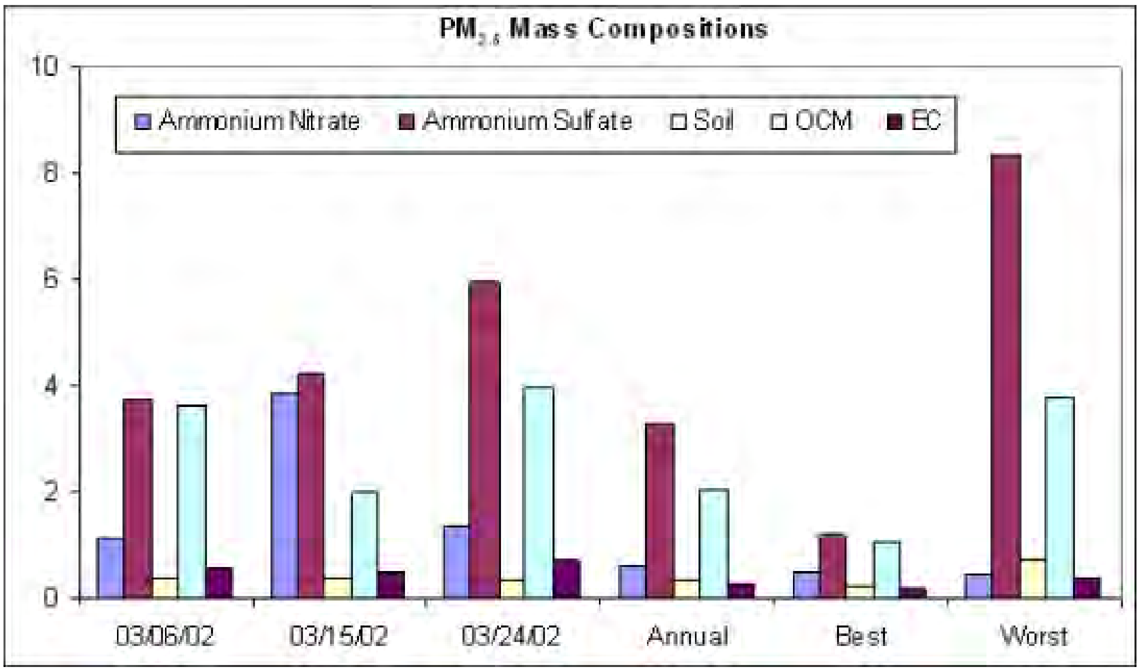

Figure C-14. $PM_{2.5}$ mass compositions for select dates and for the annual, best visibility, and worst visibility data sets.

C.10 CONCLUSIONS

Speciated $PM_{2.5}$ data collected at IMPROVE sites in Class 1 areas in Arkansas were used to determine whether such data can help to examine the influence of prescribed burning and determine if burns in the emission inventory significantly impact the $PM_{2.5}$ composition and visibility reduction. Overall conclusions include:

- Speciated $PM_{2.5}$ data at IMPROVE sites are useful for characterizing sources impacting $PM_{2.5}$ and visibility reduction, including burns.
- Influence from specific known burns (as seen by elevated concentrations of EC or K) can be seen on select days when the meteorology is conducive for transport.
- Days when high OC or EC concentrations are observed at the sites do not always coincide with known burns; however, the emission inventory is not complete and may be

missing burns in the areas of influence on these days, such as southern Oklahoma and eastern Texas.

- Meteorology plays an important role in determining the areas impacted by prescribed burns.
- EC, the primary marker of smoke, is a relatively small part of both the $PM_{2.5}$ mass and light extinction.
- Ammonium sulfate is generally the largest contributor to the $PM_{2.5}$ mass and light extinction; this component does not originate from burns. This finding is consistent with other work in the Midwest and CENRAP region including Big Bend National Park and Seney Wildlife Refuge.

C.11 RECOMMENDATIONS FOR FUTURE WORK

Additional analyses could be conducted to better quantify the influence of burns on visibility impairment. Such analyses could include:

- Apply analyses conducted in this task to additional IMPROVE sites, such as in Kansas or Minnesota to investigate whether results in this task are indicative of trends throughout the CENRAP region
- Utilize continuous $PM_{2.5}$ in conjunction with meteorological data to determine what meteorological conditions may be responsible for changes in $PM_{2.5}$ concentrations.
- Apply source apportionment tools such as UNMIX or Positive Matrix Factorization (PMF) to quantify influence of specific source types at a site using 24-hour (i.e., IMPROVE, STN, etc) or continuous speciated data (such as at Bondville or St. Louis). These tools can be used to identify individual sources such as diesel, wood burning, etc.
- Develop a better conceptual model of $PM_{2.5}$ in the CENRAP region:

  – *Are there differences in $PM_{2.5}$ composition and meteorology among different locations in the CENRAP region?* Significant differences in $PM_{2.5}$ concentrations and composition among sites in different geographic locations within the CENRAP region may provide insight into $PM_{2.5}$ transport and formation. For example, a surface high pressure system located over the Upper Midwest will often drive southeasterly winds across the CENRAP region, which can transport higher levels of $PM_{2.5}$ from upwind sources within major population centers.

  – *How are $PM_{2.5}$ concentrations and visibility dependent on large-scale meteorological patterns?* The effect of large-scale synoptic patterns on $PM_{2.5}$ concentrations and regional haze is a critical issue because synoptic patterns affect transport, vertical and horizontal dispersion, formation, and the impact of local emissions on an area. For example, transport of warm, moist air from the Gulf of Mexico may result in secondary particle formation within the CENRAP region, reducing visibility.

– *What are the compositional and meteorological differences between days of high and low $PM_{2.5}$ concentrations?* Differences in $PM_{2.5}$ composition may indicate different transport regimes, and might identify which species are dominant on high $PM_{2.5}$ days, both of which would assist forecasters. One useful way of examining the meteorology on these days is to perform several case study analyses of high and low $PM_{2.5}$ concentration episodes. A typical case study analysis would examine:

  - *Upper-air and surface synoptic patterns for each day*. These patterns assist meteorologists in determining the extent to which particles may be allowed to mix, or disperse. For example, an upper-level high pressure system is typically associated with sinking air, which will help to trap particles near the surface.
  - *Vertical temperature soundings whenever available*. Vertical temperature soundings give meteorologists the ability to assess the vertical structure of the atmosphere, in particular, how much vertical mixing can occur. Typically, a strong surface-based inversion will trap particles near the surface, allowing $PM_{2.5}$ levels to be high.
  - *Back-trajectories for each day*. Back-trajectories provide meteorologists with a tool for assessing whether transport of particles could have occurred within a region or from another region.

EXECUTIVE SUMMARY

The Central States Regional Air Planning Association (CENRAP) is researching visibility-related issues for its region and is developing a regional haze plan in response to the U.S. Environmental Protection Agency's (EPA) mandate to protect visibility in Class I areas. Mobile sources (both on- and off-road) and agricultural dust sources contribute to episodes of impaired visibility in the CENRAP region. Therefore, in support of the CENRAP's need to develop a regional haze plan, Sonoma Technology, Inc. (STI) developed emission inventories for on-road and off-road mobile sources and agricultural fugitive dust.

Appendix A, Emission Estimation Methods for Mobile Sources and Agricultural Dust Sources in the Central States, details the methods used throughout inventory development. Methods were based on EPA-accepted emissions models (e.g., NONROAD, SMOKE, and MOBILE6), emission factors gathered from EPA guidance documents or published literature, and geographic information systems (GIS) databases. Activity data sets were prepared using bottom-up methods or region-specific information whenever possible. Examples of bottom-up and region-specific data include the following:

- Facility-level estimates of cattle populations for confined animal feeding operations (CAFOs)
- Activity data gathered through telephone surveys to describe recreational boating and agricultural tilling activities
- Local activity data for commercial marine vessels and locomotives gathered directly from local agencies and industry sources, such as individual port operators and rail lines
- MOBILE6 inputs and vehicle activity data acquired from state and local information sources, including vehicle miles traveled (VMT), fleet characteristics, regulatory controls, and fuels characteristics (see Appendix C)
- Fuels characteristics acquired from state and local information sources and used as inputs for NONROAD 2004 when appropriate (see Appendix C)

Figures ES-1 and ES-2 illustrate highlights of the resultant emission inventories for on-road mobile sources, non-road mobile sources, and agricultural fugitive dust. The inventories are also tabulated in Appendix B, provided in electronic form in Appendix D, and illustrated in greater detail throughout the body of the report. In many respects, the CENRAP inventories represent substantial improvements and differ significantly from existing inventories, such as the 1999 National Emissions Inventory (NEI) and preliminary 2002 NEI, which were prepared with default guidance, national average activity data, or top-down disaggregation techniques. Some of the most important improvements include the spatial and temporal allocations of the CENRAP inventories, which are more representative and could significantly enhance efforts to perform photochemical modeling. In addition, the use of bottom-up data will lend credibility to any scientific conclusions that may be based on the CENRAP's emission inventories.

Figure ES-1 compares the CENRAP inventory to the preliminary 2002 NEI. Emissions totals of selected pollutants are plotted for the entire CENRAP region. Large revisions to the region-wide annual emissions for specific source categories produced only minor *apparent*

changes in the region-wide annual totals for all source categories. However, the use of region-wide annual totals as the basis of comparison masks the importance of large changes in state-level inventories and spatial and temporal distributions. It also underrates the disproportionate influences of certain source types on visibility in Class I areas. Class I areas are often remote and far removed from the urban areas that contribute most to region-wide inventories. Sources that tend to concentrate away from urban areas—e.g., recreational boating, agricultural activities, etc.—are likely to affect visibility in Class I areas to a greater degree than might be expected if only the relative magnitudes of their emissions are considered.

The most significant revision to the $PM_{2.5}$ emission inventory—a 22% reduction in estimated annual emissions for agricultural fugitive dust sources—was due mostly to improvements in the activity data for tilling operations. As a result of this and other more modest revisions, total $PM_{2.5}$ emissions in the CENRAP inventory are 4% less than those estimated for the preliminary 2002 NEI. Annual NO_x emissions from commercial marine vessels were estimated to be 69% less than those estimated for the preliminary 2002 NEI; and primarily as a result of this, total NO_x emissions estimated for the CENRAP are 4% less than those recorded in the preliminary 2002 NEI. Annual VOC emissions estimated for the CENRAP were 8% greater than those estimated for the preliminary 2002 NEI—a difference mostly due to improved activity data for recreational boating. The CENRAP's VOC inventory for recreational boating is more than a factor of two larger than that incorporated in the preliminary 2002 NEI. Total SO_x emissions estimated for the CENRAP are 2% less than those estimated for the preliminary 2002 NEI. This difference was due to the use of region-specific measurements of fuel sulfur contents rather than default guidance assumptions, and it corresponds primarily to 42% and 85% reductions in SO_x emissions from commercial marine vessels and "other" non-road mobile sources, respectively.[1]

Figure ES-2 illustrates selected temporal profiles developed for or applied to the CENRAP inventories. Recent research has demonstrated that emissions from on-road mobile sources follow dramatically different patterns on weekend days than on weekdays, that patterns for light-duty vehicles are unique compared to those of heavy-duty vehicles, and that activities in rural areas differ from those in urban areas (Chinkin et al., 2003; Lawson, 2003; Croes et al., 2003). The CENRAP inventories reflect this latest understanding of weekday-weekend activity patterns for on-road mobile sources. The weekday-weekend activity patterns for recreational boating, which were based on surveys of representative groups of recreational boat owners in the CENRAP region, are even more dramatic than those of on-road mobile sources. Recreational boating activities tend to be extremely concentrated on weekends (whereas the reverse is true for on-road mobile sources and to a more moderate degree) and to vary diurnally and seasonally by type of boat and geographic area. Seasonal patterns for commercial marine vessels and agricultural tilling operations—also based on bottom-up data collection efforts—are related to the climates and crop types prevalent in different geographic areas.

In summary, the CENRAP inventories of mobile sources and agricultural fugitive dust are highly region-specific, or even county-specific, and adhere closely to EPA's recommended guidance for inventory development. Additional refinements and improvements should be

[1] "Other" non-road mobile sources include all non-road mobiles sources other than locomotives, commercial marine vessels, recreational boats, and aircraft.

incorporated as better information become available. Recommended areas for future efforts and further research include (1) development of information to support day-of-week inventories (i.e., Sunday, Monday, Tuesday, etc.), rather than weekday-weekend inventories; (2) development and/or acquisition of local data as they become available (e.g., metropolitan VMT data, fuels testing programs); (3) investigation of state motor vehicle departments' records of vehicle registrations, including duplicate records and unusual age distributions; (4) use of vehicle registration records to adjust and refine VMT distributions by vehicle type; (5) continuation of bottom-up activity data acquisition for additional types of non-road mobile sources and sources of agricultural fugitive dust (such as agricultural equipment, construction and mining equipment, recreational all-terrain vehicles (ATVs), lawn and garden equipment, cotton ginning operations, and/or crop transport); and (6) development of process-based methods or emission factors to improve inventories of agricultural fugitive dust emissions.

1. INTRODUCTION

The Central States Regional Air Planning Association (CENRAP) is developing a regional haze plan in response to the U.S. Environmental Protection Agency's (EPA) mandate to protect visibility in Class I areas.[2] To develop an effective regional haze plan, the CENRAP ultimately must develop a conceptual model of the phenomena that lead to episodes of low visibility in the CENRAP region. Thus, the CENRAP is researching visibility-related issues for its region, which includes Texas, Oklahoma, Louisiana, Arkansas, Kansas, Missouri, Nebraska, Iowa, and Minnesota. Both primary particulate matter (which is emitted directly to the atmosphere in particulate form) and the formation of secondary particulate matter (which is generated from chemical transformations in the atmosphere of gaseous precursor species such as ammonia, nitrogen oxides, sulfur oxides, and volatile organic compounds) contribute to regional haze issues in the CENRAP region. In recognition of these issues, the CENRAP sponsored the development of improved emission inventories for mobile sources and sources of agricultural dust.

In support of the CENRAP's need to develop a regional haze plan, Sonoma Technology, Inc. (STI) conducted CENRAP Work Assignment Number 03-0214-RP-003-004, "Mobile Source and Agricultural Dust Emission Inventory Development for the Central States." Consistent with the project goals presented in the Work Plan and Methods Document (Sullivan, 2004; Reid et al., 2004b), emissions were calculated for on-road mobile sources, off-road mobile sources, and sources of fugitive agricultural dust throughout the CENRAP region. Bottom-up or region-specific activity data were developed to model emissions from these source categories. These data were developed for compatibility with the MOBILE6 and NONROAD models; SMOKE 1.5 (which runs MOBILE6 internally); and the latest version of the National Emission Inventory Input Format (NIF).

1.1 BACKGROUND AND KEY ISSUES

1.1.1 Prior Status of the Emission Inventories

As a whole, few areas of the CENRAP region have experienced significant air quality problems in the past. Therefore, emission inventories and regionally representative activity data are relatively incomplete or scarce. In most areas of the CENRAP, existing emission inventories are based on the EPA's nationally representative defaults, which could be greatly improved with local or region-specific data, such as region-specific or state-specific fleet characteristics and improved vehicle miles traveled (VMT) estimates for rural areas. Prior to the completion of this project, the most comprehensive source of emissions estimates available for the CENRAP region was the EPA's National Emissions Inventory (NEI), which is used as the basis of the EPA's National Emission Trends (NET) document series and analyses (U.S. Environmental Protection Agency, 2003a, 2004a). In the NEI, estimates of emissions from mobile sources and sources of agricultural dust in the CENRAP region amount to 4% to 49% of the total inventories of nitrogen

---

[2] Class I areas include national parks, wilderness areas, and national monuments. These areas have been granted special air quality protections under the federal Clean Air Act.

oxides (NO_x), volatile organic compounds (VOC), particulate matter of 2.5 microns aerodynamic diameter or less ($PM_{2.5}$), sulfur dioxide (SO_2), and ammonia (NH_3) for the region (see **Table 1-1**). The NEI indicates that fugitive dust from agricultural tilling operations is a significant $PM_{2.5}$ source, particularly in of Iowa, Kansas, and Nebraska. Mobile sources are a significant source of NO_x and VOC, particularly in Minnesota and Missouri.

The most significant sources of uncertainties in the NEI are associated with the national-scale representativeness and top-down methods that were applied to generate the inventory (approaches that were dictated by resource constraints). The results of this project substantially address these weaknesses of the NEI for the CENRAP region. As a result, the emission inventories produced through this project differ significantly from the emissions estimates in the NEI in a number of areas.

Table 1-1. Estimates of emissions in the CENRAP region from the preliminary 2002 NEI (U.S. Environmental Protection Agency, 2004a).

1.1.2 Current Status of the CENRAP Emission Inventories

As detailed in the attached Methods Document (Appendix A), emissions estimates were prepared for mobile sources and sources of agricultural dust throughout the CENRAP region. These emission inventories were prepared with EPA-accepted emissions models (e.g., NONROAD, SMOKE, and MOBILE6), emission factors gathered from EPA guidance documents or published literature, and geographic information systems (GIS) databases of land cover. All activity data sets were prepared using bottom-up methods or region-specific information whenever possible.

The MOBILE6 emissions model, the EPA's approved emission factor model for on-road mobile sources, was operated within SMOKE 1.5 to produce emission factors for January and July at the county level. Spatially and temporally distributed MM5 temperature fields for each day in January and July 2002 were averaged and used as inputs for these MOBILE6 runs so that outputs would represent an entire month rather than a specific episode date. The MOBILE6 outputs were matched with region-specific, county-level estimates of VMT, which also were distributed seasonally and by day of week according to temporal profiles, to estimate county-level emissions for the winter and summer runs. January and July emissions were averaged to estimate annual emissions at the county level. MOBILE6 inputs were prepared at the county level to represent region-specific fleet distributions, fuels characteristics (which can also vary by season), and local regulations (e.g., inspection and maintenance programs, etc.).

The latest version of the NONROAD emissions model (NONROAD 2004), the EPA's approved emission factor model for most off-road mobile sources, was used to produce emissions estimates at the county level for most off-road sources. In addition, EPA guidance documents were consulted for emissions estimation methods for locomotives and commercial marine vessels (U.S. Environmental Protection Agency, 1999c, 1998b, 2000, 2003b, 1999a, 1997, 1992). Bottom-up activity data were gathered for recreational boats, locomotives, and commercial marine vessels—considered to be the most important or uncertain off-road mobile sources affecting regional haze in the CENRAP region. For other source categories, NONROAD default activity data were used in conjunction with region-specific fuels information to estimate emissions. Emissions from aircraft were considered to be a lower priority than other nonroad mobile sources and were not included in the scope of this project.

The Emission Inventory Improvement Program and recent research findings from the University of California at Davis and Texas A&M University were consulted for emission factors and emissions estimation methods for agricultural fugitive dust sources (U.S. Environmental Protection Agency, 2004b; Goodrich et al., 2002; Flocchini and James, 2001). County-level annual emission inventories were prepared for agricultural tilling operations and confined animal feeding operations (CAFOs). Bottom-up activity data included facility-specific animal populations developed for CAFOs in the CENRAP region (Coe and Reid, 2003), agricultural tilling activity information developed through systematic telephone surveys of county agricultural extension services (AES) throughout the CENRAP region (Reid et al., 2004a), and county-level estimates of crop-acreages in 2002 from the National Agricultural Statistics Service (NASS).

The resulting emission inventories are illustrated in **Figures 1-1 through 1-6** and tabulated in Appendix B. In all cases, the inventories were based on generally accepted emission factors and the most complete and up-to-date activity data sets that could be identified and acquired. However, we recognize that available emission factors are uncertain and continue to be the subject of research. In anticipation of future efforts to improve emissions estimation techniques and to further develop or improve the CENRAP's inventories, the deliverables of this project include systems of data files that can be updated with revised emission factors, activity data, and/or emissions estimates as new information becomes available (see Appendix D).

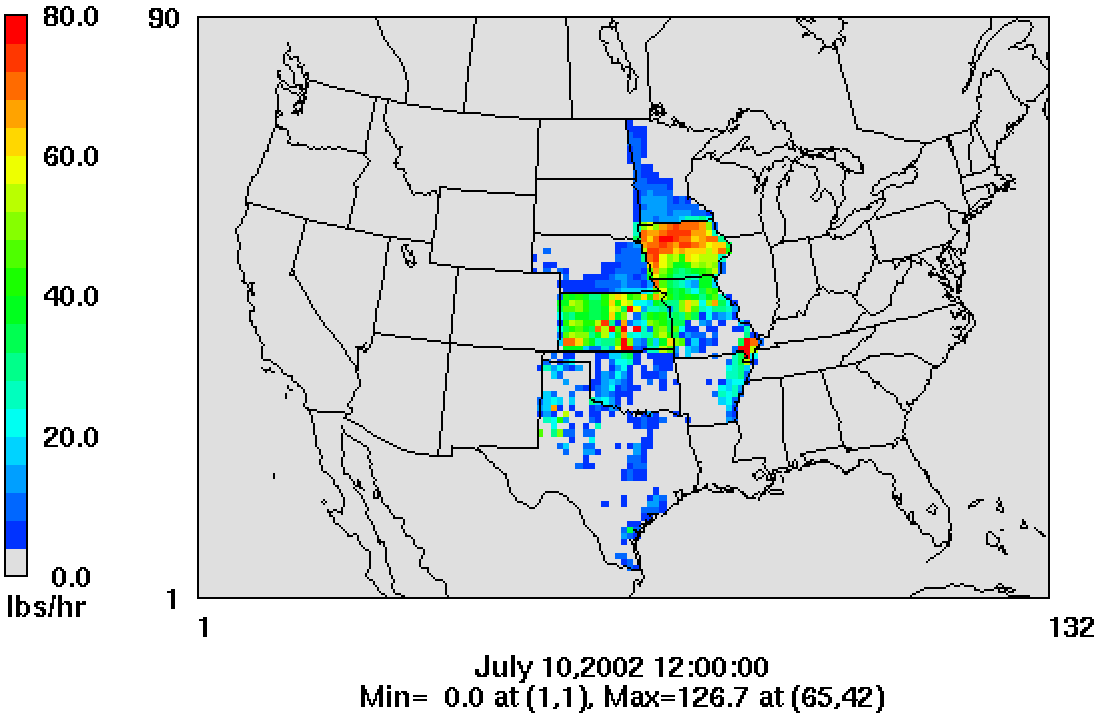

Figure 1-6. Geographic distribution of $PM_{2.5}$ emissions from sources of agricultural fugitive dust in the CENRAP states on July 10, 2002.

Of the mobile and agricultural fugitive dust sources discussed throughout this report, those that we qualitatively consider to contribute the greatest degrees of uncertainty to the emissions for the CENRAP region are agricultural fugitive dust sources and “other” non-road mobile sources.[3] The most effective strategies to improve these components of the inventory in the future would be to develop process-based emissions estimation techniques for agricultural fugitive dust sources and to prioritize and gather bottom-up activity data for “other” non-road mobile sources (as was done through this project for recreational boating). These recommendations are discussed in more detail in Section 3.

[3] “Other” non-road mobile sources include all non-road mobiles sources other than locomotives, commercial marine vessels, recreational boats, and aircraft.

2. SUMMARY AND ASSESSMENT OF THE INVENTORIES

STI calculated emissions as detailed in Appendix A, Emission Estimation Methods for Mobile Sources and Agricultural Dust Sources in the Central States, with results tabulated in Appendix B, Annual Emissions by State and Source Category. In addition, STI carried out quality assurance procedures as provided in the Quality Assurance Project Plan (QAPP) (Sullivan, 2004) and as detailed in this section. In summary, emissions from on-road mobile sources were estimated to contribute 20% and 28% of total annual emissions of VOCs and NO_x in the CENRAP region, while non-road mobile sources were estimated to contribute 23% and 18%, respectively. Agricultural dust sources were estimated to contribute 17% of total annual $PM_{2.5}$ emissions. Emissions for many of these source categories vary seasonally, daily, and hourly. Emissions of NO_x and VOC from on-road mobile sources peak in the summer with somewhat increased vehicle activity (VMT); however, emissions of CO from on-road mobile sources peak in the winter due to colder ambient temperatures. In addition, diurnal and day-of-week patterns of emissions from on-road mobile sources vary. On-road mobile emissions are generally greater on weekdays than on weekend days; and weekday driving activities track the morning and afternoon commute patterns, while weekend driving activities do not. The variation of seasonal, diurnal, and day-of-week patterns for recreational boats is even more pronounced than that for on-road mobile sources. Emissions from recreational boats are highly concentrated in the summer months (except in the warmest, most southern states) and on weekend days. Recreational boating activities peak sharply between 0700 and 1000 and decline gradually throughout the day. Emissions from commercial marine vessels also follow a seasonal pattern (except in the warmest, most southern states). Emissions from locomotives vary minimally or negligibly by season, day of week, and hour of day. Emissions from agricultural tilling operations follow seasonal patterns that are unique to each state and dependent on the climatic conditions and types of crops grown in each state.

2.1 EMISSIONS FROM ON-ROAD MOBILE SOURCES

2.1.1 Summary of Emissions from On-Road Mobile Sources

Over 525 billion VMT were estimated to have occurred in 2002 in the CENRAP region, with consequent emissions as shown in **Table 2-1** and **Figure 2-1**. **Figure 2-2** illustrates the geographic distribution of on-road mobile source emissions for a selected date.

Appendix C provides graphical and tabular summaries of the activity data that were prepared for the emission inventories of on-road mobile sources, including VMT, fleet distributions, fuels characteristics, and regulatory controls. Whenever possible, VMT were acquired from local air quality agencies or metropolitan planning organizations and HPMS data were used as defaults for areas without local VMT estimates. VMT data were provided by local agencies for approximately 25% of the counties in the CENRAP region, while the remainder are from the HPMS data. Areas that were able to provide local estimates of VMT included Houston/Galveston, Texas; Beaumont/Port Arthur, Texas; Dallas-Ft. Worth, Texas; Baton Rouge, Louisiana; New Orleans, Louisiana; St. Louis, Missouri; and Lincoln, Nebraska. Metropolitan areas that have recently produced local estimates of VMT (or will do so very

shortly) include Kansas City, Minneapolis-St. Paul, and Little Rock. In the future, these locally generated VMT estimates should be used to improve the emission inventories for the CENRAP region.

Fleet distributions were developed by acquiring records of vehicle registrations from the departments of motor vehicles in each CENRAP state. These records were decoded using the Eastern Research Group (ERG) Vehicle Identification Number (VIN) Decoder program. Fleet distributions by vehicle type, vehicle age, and fuel type were calculated on the basis of the ERG VIN Decoder outputs. In several states, the fleet distributions differed significantly from national average distributions, which correspond to MOBILE6 model defaults.

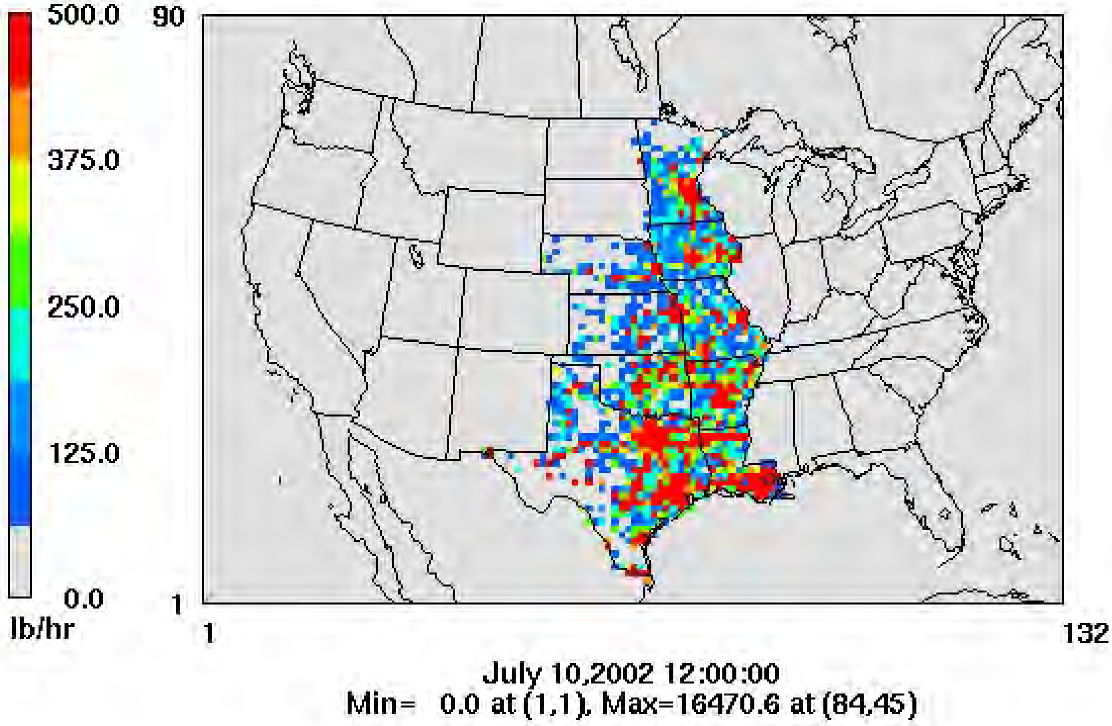

Figure 2-2. Geographic distribution of on-road mobile source emissions of NO_x in the CENRAP states on July 10, 2002.

Fuels characteristics (e.g., sulfur content, volatility, and oxygenate content) required by MOBILE6 were acquired for most CENRAP states from Northrop Grumman. However, for Kansas, Minnesota, and Missouri, data from state departments of agriculture were used because they proved to be more extensive than the Northrop Grumman data. Information on regulatory programs (such as inspection and maintenance programs) was acquired by contacting the state and local personnel involved with these programs.

MOBILE6 was run in SMOKE using gridded, hourly temperature data from meteorological files created by the Meteorology Chemistry Interface Processor (MCIP), a mesoscale model (MM5) post-processing program. Meteorological data files for all of January and July, 2002 were provided by the CENRAP Modeling Work Group, and these files were used to derive monthly average temperatures by hour so that MOBILE6 runs would be representative of entire months rather than specific episode dates.

On-road mobile source emissions were temporally allocated using temporal profiles derived from a variety of sources (see **Figures 2-3 through 2-5**). The monthly profiles for light-duty vehicles and heavy-duty vehicles were derived from national-level sales of gasoline and diesel fuels during 2002 (Energy Information Administration, 2003). SMOKE default weekly temporal profiles were used for light-duty vehicles because they were considered to be consistent with the latest research on weekday-weekend activity patterns. The weekly profile for heavy-duty vehicles was derived from traffic counts conducted in California's South Coast Air Basin

(Coe et al., 2004). County-specific data obtained from the Texas Transportation Institute and the East-West Gateway Coordinating Council were used to develop diurnal profiles for light-duty vehicles in Texas and five counties in the St. Louis area of Missouri. For the remainder of Missouri and all other states, a default SMOKE/EPA diurnal profile for weekdays was used for light-duty vehicles in urban and suburban areas, and a weekday rural profile was developed from the Texas data and applied to counties not associated with a Metropolitan Statistical Area (MSA). A weekend diurnal profile for light-duty vehicles and both a weekend and weekday profile for heavy-duty vehicles were derived from traffic counts conducted in California's South Coast Air Basin (Coe et al., 2004) and used for all CENRAP states. **Figure 2-5** shows all diurnal profiles used except county-specific profiles used for Texas and Missouri, which are detailed in Appendix C.

2.1.2 Assessment of On-Road Mobile Source Emissions

The emission inventories for on-road mobile sources are based on extensive region-specific information, including VMT data, fleet characteristics, temporal distributions, and regulatory program descriptions. These estimates were also strengthened by the use of gridded, hourly temperature data. The importance of using state and county-specific data can be seen in a comparison of the CENRAP's inventory with the preliminary 2002 NEI. As **Figure 2-6** shows, both inventories estimate 1.5 million tons of NO_x from on-road mobile sources for the CENRAP region as a whole. However, significant differences exist at the state level. For example, Louisiana's NO_x emissions are 27% higher than the estimates from the NEI, while Missouri's NO_x emissions are 16% lower. Differences are apparent at the CENRAP region-wide scale for VOC emissions, which are about 10% lower than those in the NEI, while region-wide $PM_{2.5}$ and SO_2 estimates are about 20% lower. These differences seem to arise primarily from the use of more localized temperature data, fuel volatility data, and fuel sulfur contents. For example, the 2002 NEI assumes an across-the-board diesel sulfur content of 500 ppmw (the regulatory limit), whereas the state-specific data used in this inventory ranged from 330-390 ppmw for the various CENRAP states. Further improvements could be made by continuing to acquire and incorporate local data. For example, improved VMT data are now available for the Kansas City metropolitan area and should be incorporated into future inventory efforts.

Further improvements to the VMT distributions for light-duty vehicle types may be feasible by applying vehicle registration data in novel ways. Many light-duty and/or diesel trucks (e.g., SUVs) are driven for similar purposes as passenger vehicles—a trend that was established in the 1990s and that continues to strengthen. Therefore, the ratio of registered SUVs to registered light-duty autos is likely to be proportional to the VMT traveled by these vehicle types. Alternatively, the VMT mix could be calculated from registration data using vehicle type-specific assumptions about annual mileage accumulation rates (AMAR), which are inherent to the MOBILE6 model. Such adjustments to the VMT distributions may be beneficial because emission factors vary significantly by light-duty vehicle class and fuel type and because MOBILE6 default VMT distributions may be out-of-date due to the rapidly increasing popularity of SUVs and light trucks.

Finally, it should be noted that an "annualized" on-road mobile source inventory was assembled as an average of SMOKE/MOBILE6 runs performed for January and July—a necessity given the current availability of meteorological data. The inventory could be improved by performing runs for all 12 months of the year as new meteorological inputs become available. However, this would likely produce only minor or insignificant changes in annual total emissions.

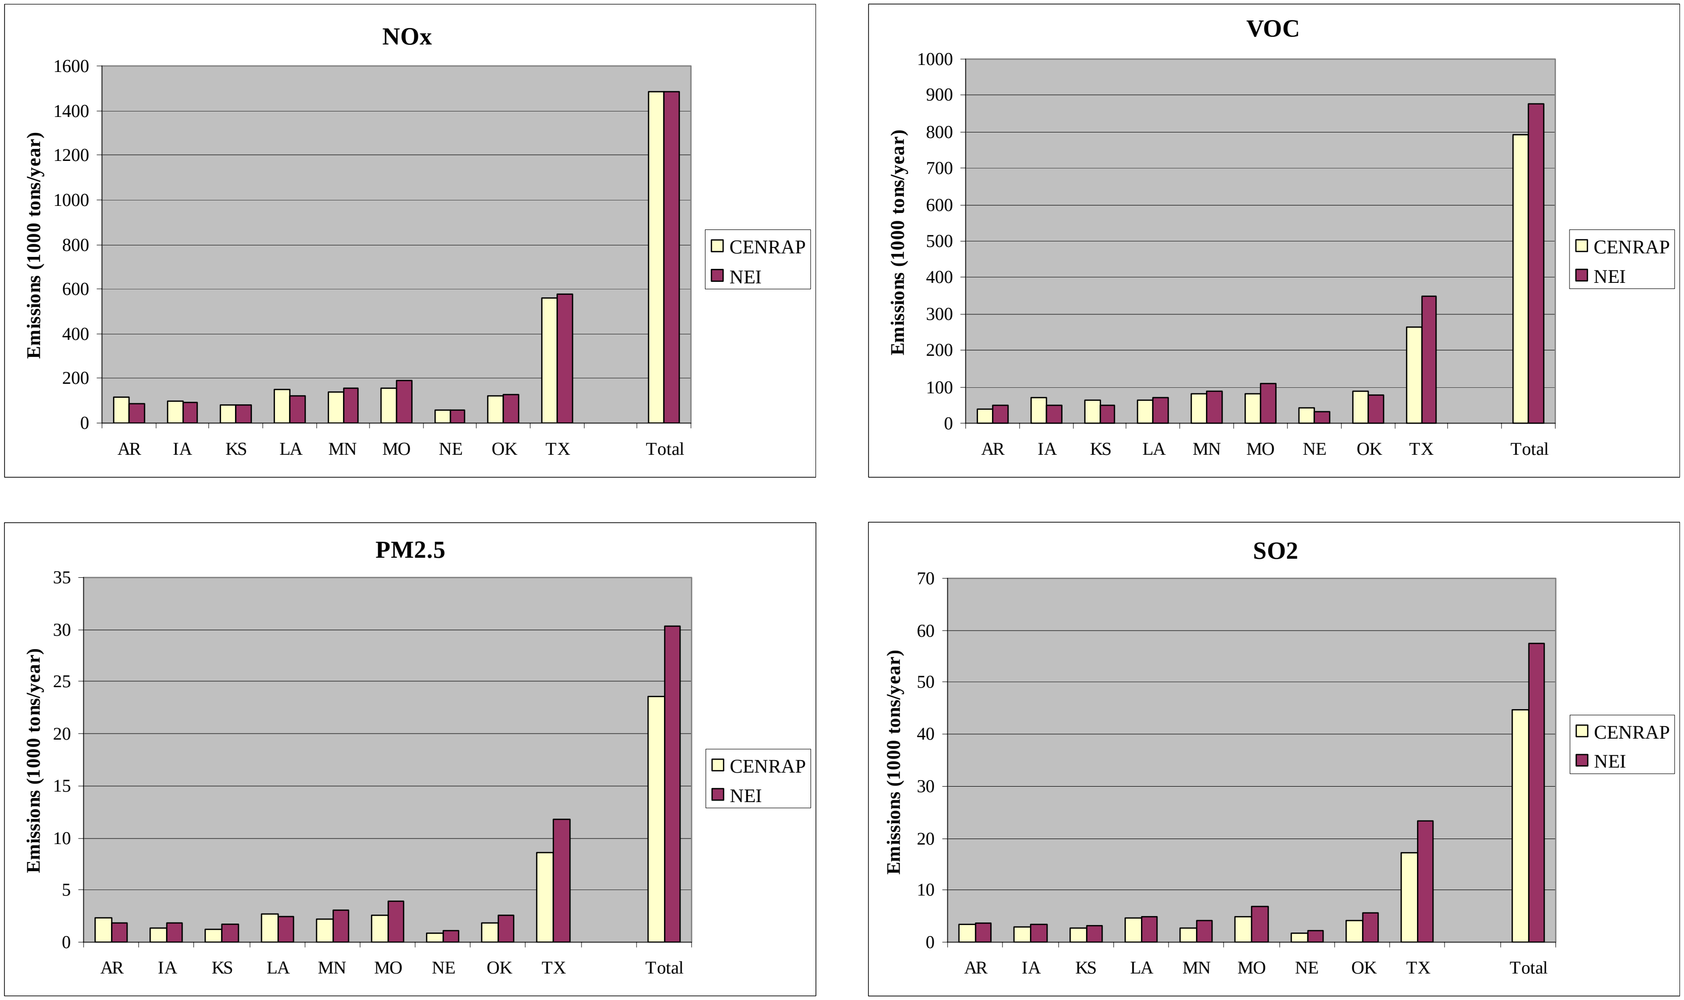

Figure 2-6. Comparison of CENRAP's emission inventories for on-road mobile source to the 2002 preliminary NEI.

2.2 EMISSIONS FROM NON-ROAD MOBILE SOURCES

2.2.1 Summary of Emissions from Locomotives

Emission estimates were generated for Class I line haul, Class II and III[4] line haul, and yard (or switching) locomotives throughout the CENRAP region using fuel consumption and traffic density data obtained from individual railroads, federal agencies, and other sources. Almost 1.5 billion gallons of diesel fuel were estimated to have been consumed by locomotives in the CENRAP region in 2002, with consequent emissions as shown in **Table 2-2** and **Figure 2-7**. **Figure 2-8** illustrates the geographic distribution of locomotive emissions for a selected date, and **Figure 2-9** shows the monthly variability in locomotive activity, which is based on weekly summaries of carloads of freight moved nationally during 2002.

Table 2-2. 2002 fuel consumption and emissions (tons) for locomotives in CENRAP states.

Page 1 of 2

State	Fuel Consumption (1000 gallons)	$PM_{2.5}$	CO	NO_x	SO_2	VOC	NH_3
Arkansas							
Class I Line Haul	79,645	530	2,334	16,769	1,434	880	7

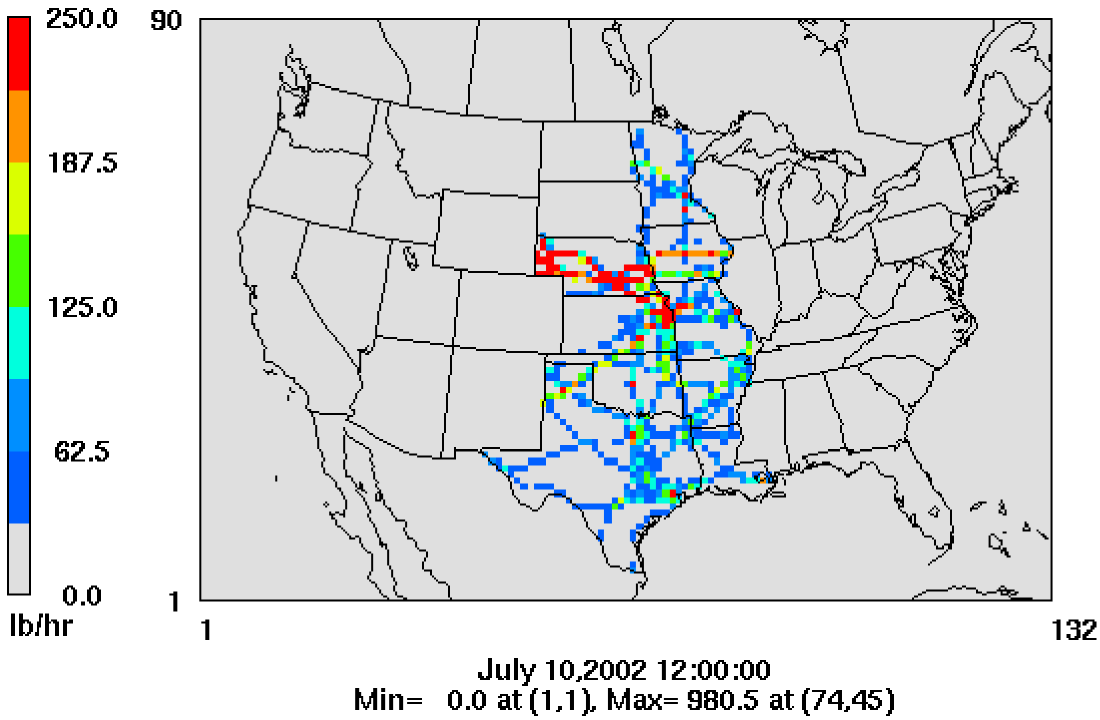

Figure 2-8. Geographic distribution of locomotive emissions of NO_x on July 10, 2002.

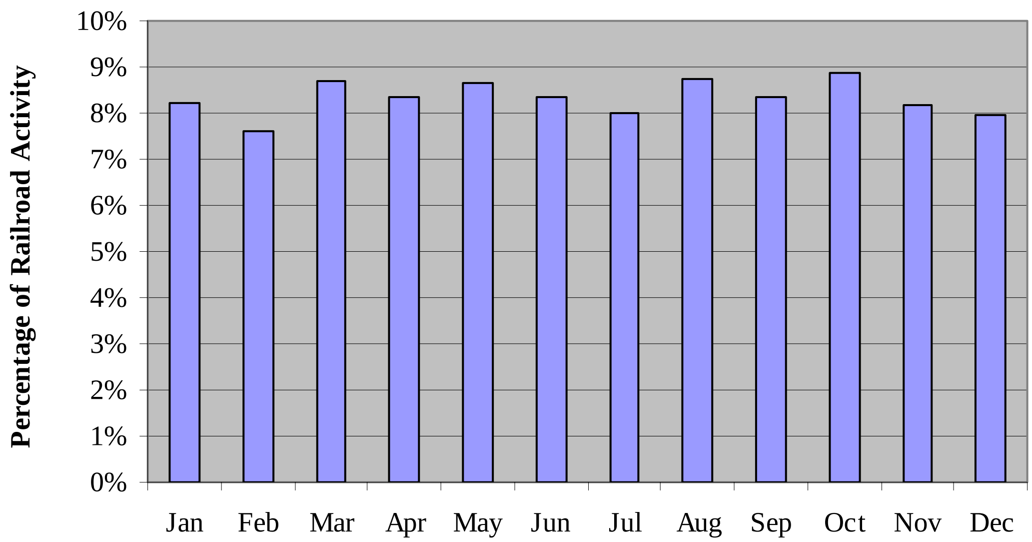

Figure 2-9. Monthly variability in locomotive activity.

2.2.2 Assessment of Emissions from Locomotives

Most of the effort of emission inventory development for locomotives was directed toward Class I railroads, which, though small in number, typically account for over 90% of the annual fuel consumption by railroads in the United States (U.S. Environmental Protection Agency, 1998a). Fuel consumption and traffic density data for 2002 were obtained for all eight Class I railroads operating in the CENRAP states, and this information was used to generate county-level emission estimates. Although less effort was expended on smaller railroads, representative bottom-up data sets were collected, including 2002 fuel consumption data for six of the 14 Class II railroads, and either fuel consumption data or yard locomotive fleet sizes for 35 of the 113 Class III and switching railroads that operate in the CENRAP region. Overall, of 1.48 billion gallons of fuel consumed by railroads in the CENRAP region for 2002, 1.44 billion gallons (or 97%) were directly reported by individual railroads, while the remainder were extrapolated from activity patterns. Therefore, the vast majority of the emission inventory for locomotives is based on directly reported, bottom-up activity data.

Figure 2-10 compares the CENRAP's inventory with the 2002 preliminary NEI inventory. CENRAP's emission estimates for most pollutants are about 50% higher than those in the NEI with the exception of NO_x, for which the CENRAP and NEI emission estimates are roughly equal. "Uncontrolled" emission factors were applied across the board for the 2002 NEI, which offset a corresponding underestimate of locomotive activity levels in the CENRAP area. CENRAP's NO_x inventory for locomotives reflects existing federal emission standards for locomotives. These emission standards, which took effect with the 1973 model year, predominately affect NO_x emissions. Therefore, although activity levels estimated for the CENRAP inventory were higher than those estimated for the NEI, the resultant NO_x emissions are about the same.

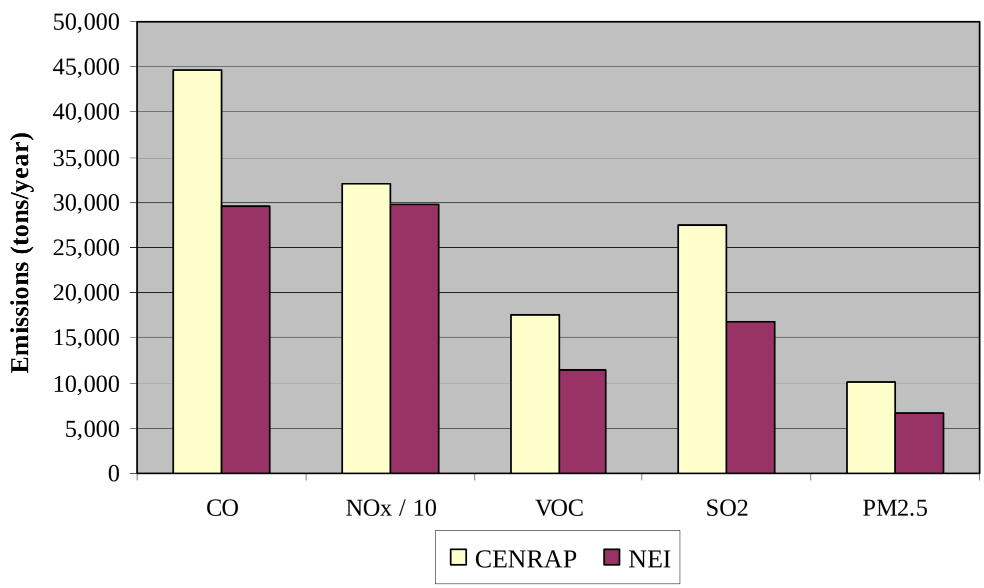

Figure 2-10. Comparison of locomotive emissions estimates with results from the 2002 preliminary NEI (note: NO_x emissions have been divided by 10 for scaling purposes).

Use of 2002 railroad-specific fuel consumption estimates and emission factors reflective of existing emissions standards greatly improved the degree of certainty in the CENRAP region-wide emission inventory above that associated with the preliminary 2002 NEI. Additional survey work could improve the accuracy of the inventory, but this improvement would likely be significant only at county or metropolitan scales where railroad activities are dominated by Class II or III railroads. In addition, local data would likely be more representative of variances in local activity patterns than the national-level data that were used to create a monthly temporal profile.

2.2.3 Summary of Emissions from Commercial Marine Vessels

Emission estimates were generated for commercial marine vessels operating in commercially active waterways in the CENRAP region, including inland river systems, Lake Superior, and the Gulf Intracoastal Waterway (GIWW). County-level emissions were designated as either “in-port” or “underway”, as shown in **Table 2-3** and **Figure 2-11**. **Figure 2-12** illustrates the geographic distribution of commercial marine emissions for a selected date, and **Figure 2-13** shows the monthly variability in commercial marine activity by state, with profiles based on monthly summaries of freight movements through selected locks and ports for 2002.

Table 2-3. 2002 commercial marine vessel emissions (tons) in CENRAP states.

State	Type	CO	NOx	VOC	SO2	PM2.5	NH_3
Arkansas	Port	13	68	1	6	1	0
	Underway	1,783	9,274	193	889	197	4
Iowa	Port	55	286	6	27	6	0
	Underway	534	2,776	58	266	59	1
Kansas	Port	2	9	0	1	0	0
	Underway	4	22	0	2	0	0
Louisiana	Port	2,719	20,772	739	5,369	693	6
	Underway	6,912	48,574	999	7,082	1,221	7
Minnesota	Port	211	1,533	57	230	37	1
	Underway	492	2,822	65	484	79	1
Missouri	Port	585	4,281	170	443	84	2
	Underway	1,472	7,656	159	734	163	3
Nebraska	Port	1	3	0	0	0	0
	Underway	5	27	1	3	1	0
Oklahoma	Port	1	5	0	0	0	0
	Underway	97	505	10	48	11	0
Texas	Port	1,613	12,300	423	4,315	526	3
	Underway	1,882	13,009	300	5,778	686	3
Total		18,381	123,922	3,182	25,677	3,764	32

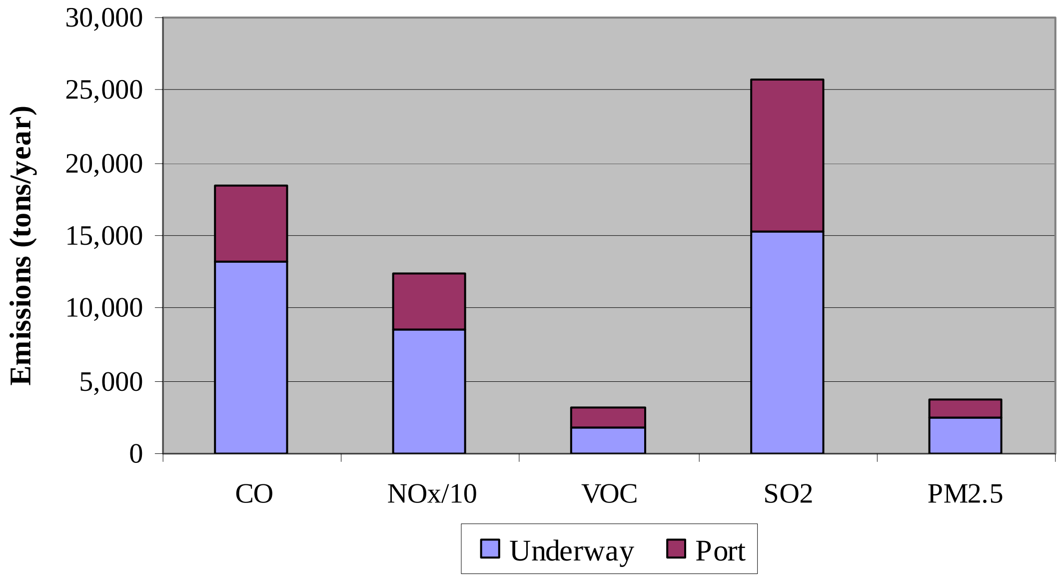

Figure 2-11. Annual commercial marine vessel emissions by pollutant and source type for the CENRAP region (note: NO_x emissions have been divided by 10 for scaling purposes).

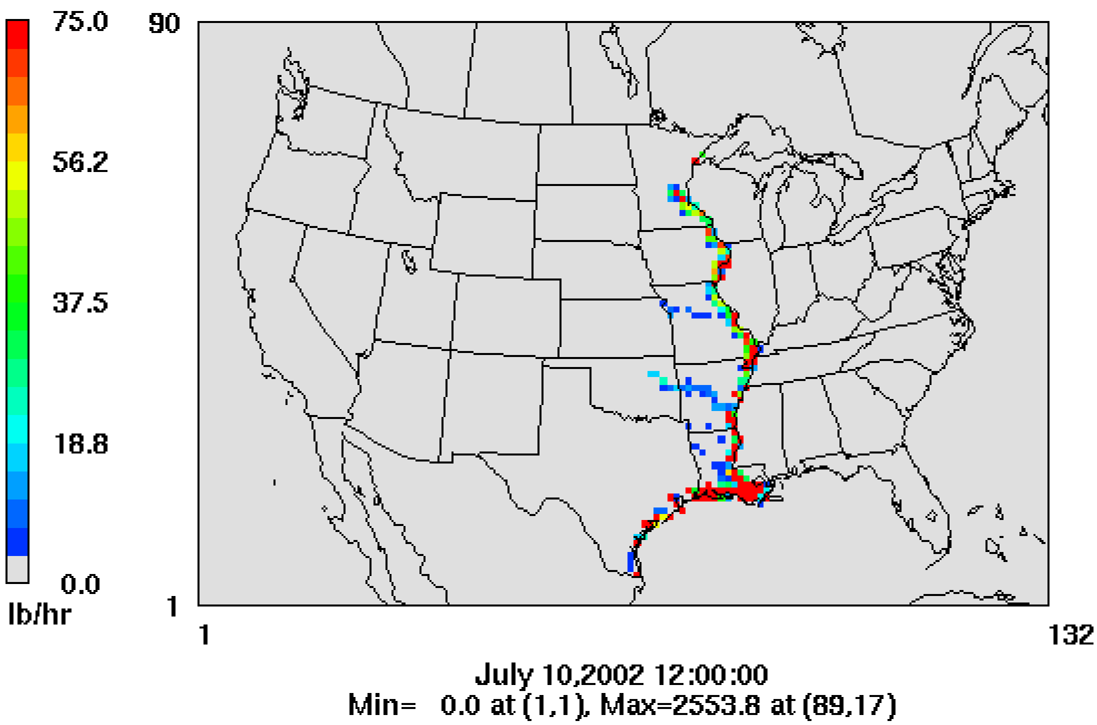

Figure 2-12. Geographic distribution of commercial marine emissions of NO_x in the CENRAP states on July 10, 2002.

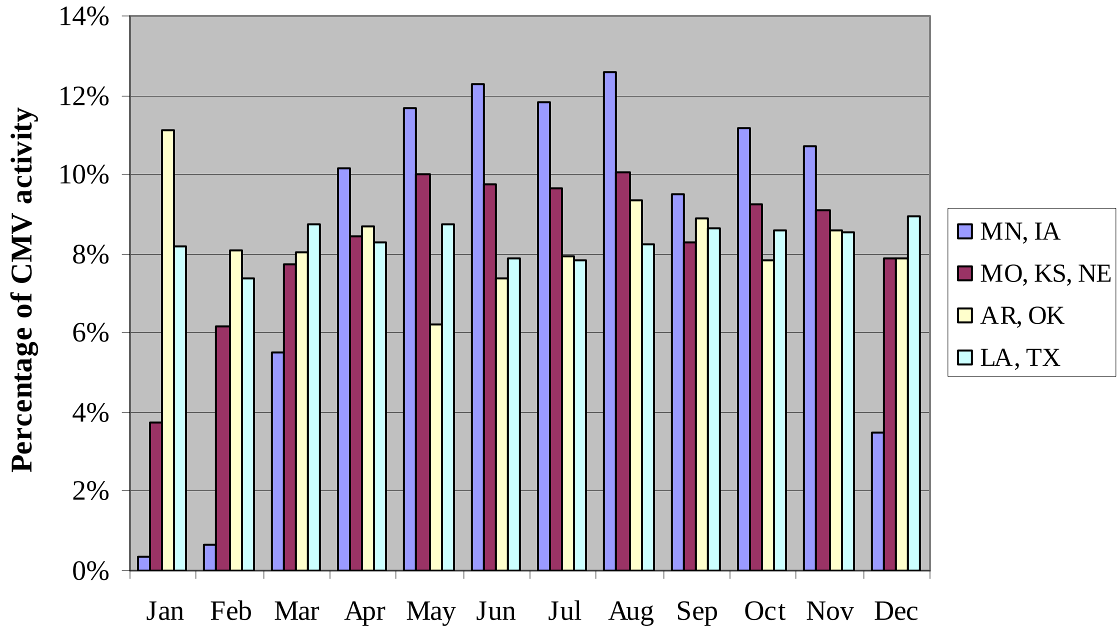

Figure 2-13. Monthly variability in commercial marine vessel activity.

2.2.4 Assessment of Emissions from Commercial Marine Vessels

Emission estimates for this inventory differ significantly from those found in the preliminary 2002 NEI. CENRAP's emissions are lower by approximately a factor of 3 for all pollutants (see **Figure 2-14**). Emissions in Louisiana and Texas account for most of the emissions and much of the overall difference, as seen in **Figure 2-15**.

For inland river systems in the CENRAP region, emission estimates were based on bottom-up fuel consumption data derived from the Tennessee Valley Authority (TVA) Barge Costing Model. This model was developed to estimate fuel usage by inland river segment for fuel tax purposes, and annual model results have varied from actual tax receipts by an average of only 1.5% since 1996. The results indicate that the activity data used to estimate emissions for most of the CENRAP region (including all of Arkansas, Iowa, Kansas, Missouri, Nebraska, and Oklahoma) have a high degree of certainty.

However, the TVA model does not cover fuel consumption by "deep-draft" (oceangoing) vessels, harbor tugs, and other vessels that operate around ports in the Great Lakes or the Gulf Inland Waterway of Louisiana and Texas. In these cases, emission estimates were prepared using work-based (rather than fuel-based) emission factors and a complex array of activity data, including the number of vessel calls at specific ports, vessel speeds, and vessel characteristics (such as engine horsepower, load factors, etc.). Although detailed information was available for several important ports in the CENRAP region, including St. Louis, Baton Rouge, New Orleans, South Louisiana, and Corpus Christi, a complete survey of ports in Louisiana, Texas, and Minnesota was not possible within the scope of this project. Therefore, data from "known" ports were extrapolated to "unknown" ports using techniques outlined in a two-volume report produced by ARCADIS on behalf of the EPA (U.S. Environmental Protection Agency, 1999a).

Improvements to the inventory could be made at local scales by gathering more detailed data on individual ports within a county or region.

The difference between the CENRAP inventory and the preliminary 2002 NEI is most likely due to the use of top-down methods to develop the 2002 NEI, for which national-level emissions were calculated from estimated annual hours of operation and fuel consumption for the U.S. commercial marine fleet, then disaggregated to port and underway emissions based on the simplifying assumption that 75% of distillate fuel and 25% of residual fuel is consumed “in-port”. National-scale, in-port emissions were then assigned to the largest 150 ports in the country based on the amount of freight handled by each, and the remaining “underway” emissions were assigned to active shipping lanes based on traffic density patterns (U.S. Environmental Protection Agency, 1999b). These methods seem to have resulted in significantly overestimated emissions at large ports, as seen in **Table 2-4**, which compares “in-port” emissions from the 2002 NEI for the counties containing the Port of Baton Rouge and the Houston-Galveston Port with other estimates of emissions for these same ports. CENRAP’s emission inventories for these ports are more closely aligned with previous estimates prepared by Booz Allen Hamilton (1991) and Eastern Research Group & Starcrest (2003), both of whom also applied bottom-up activity data to prepare their inventories.

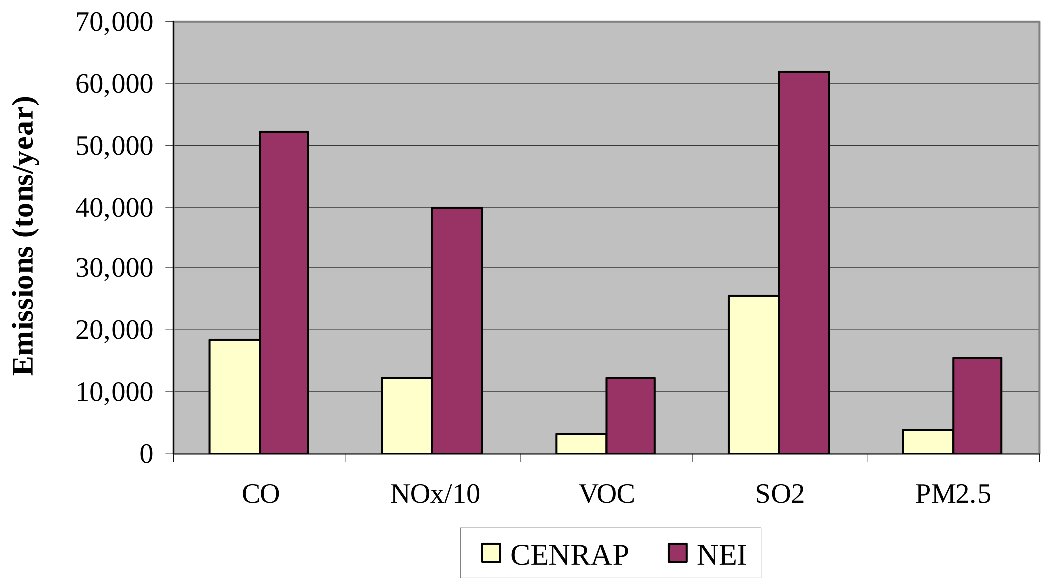

Figure 2-14. Comparison of commercial marine emissions estimates with results from the 2002 preliminary NEI (note: NO_x emissions have been divided by 10 for scaling purposes).

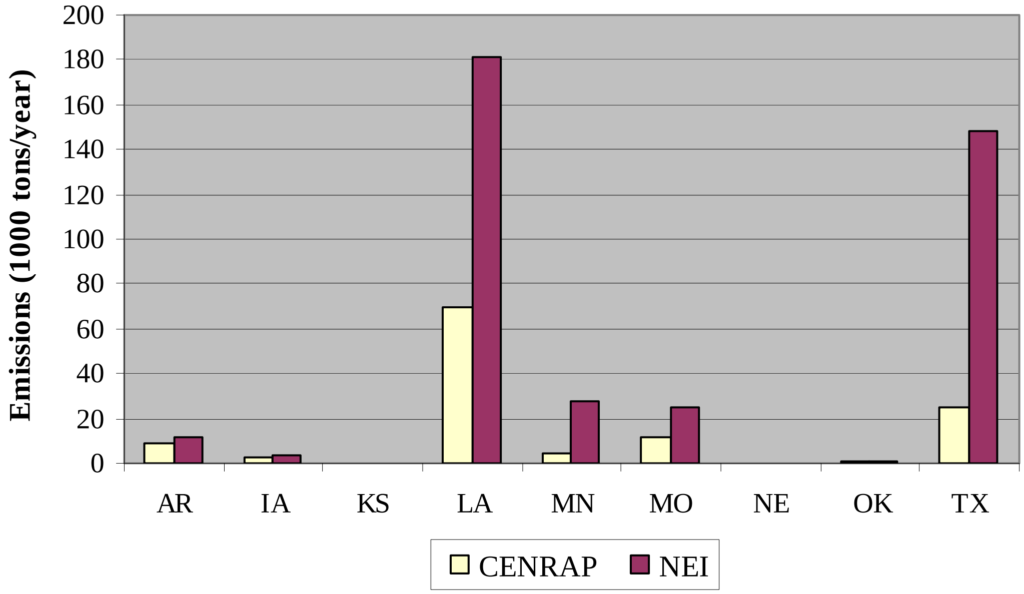

Figure 2-15. State-by-state comparison of commercial marine NOx emissions.

	2002 NEI	2,955	75,787	9,989	2,370	11,111

2.2.5 Summary of Emissions from Recreational Boats

Emissions from recreational boats were calculated with the latest version of the EPA's NONROAD model (NONROAD 2004). NONROAD produces county-level emission estimates for several categories of recreational boats using national equipment populations, which are disaggregated to the county level on the basis of the total water surface area in a given county. NONROAD also relies on broad assumptions related to boating activity (such as annual hours of operation, engine load factors, and temporal variations in activity). These assumptions vary by equipment type but not geographic area. The activity data files used by the NONROAD model were updated for the CENRAP inventory with information gathered through a bottom-up survey of representative groups of recreational boat owners. The survey was designed to gather data on vessel characteristics, hours of use, fuel consumption, engine loads, and temporal and geographic

usage patterns in each of the CENRAP states. Data assembled through this survey were then incorporated into the NONROAD model, along with state-specific data on temperatures and fuels characteristics.[5] The more significant survey results showed that boating activities varied substantially by state in most respects, including types of boats used, diurnal patterns of boating, seasonal patterns of boating, and hours of boat use.

One of the challenges associated with conducting the recreational boating survey and analyzing results was the tendency of survey respondents to generally over-report their use of recreational boats. This phenomenon, called "reporting bias", often occurs when survey respondents have non-neutral attitudes about the behaviors they report. Under-reporting of illicit behaviors (such as use of illegal drugs or driving above posted speed limits) and over-reporting of positive behaviors (such as exercising regularly or volunteering for charity) are commonly observed, unless surveys are designed to control or eliminate these biases. The CENRAP recreational boating survey was designed to control for reporting bias. Respondents were asked about their "typical" usage pattern, but they were also asked about their specific usage pattern for the preceding week—information that is much more likely to be reported accurately. The average usage pattern for the preceding week was used to adjust reported "typical" usage patterns, which greatly reduced the effects of over-reporting by factors of 1.5 to 2.0. In addition, respondents were asked about the quantities of fuel purchased for their recreational boats—information that could be used as a second check of reporting bias. On the basis of reported fuel consumptions, recreational boating usage was further reduced for over-reporting bias by a factor of 0.3 (with a range of uncertainty from 0.0 to 0.5). The resulting database of activity levels in the CENRAP region indicates greater usage of recreational boats than the NONROAD 2004 defaults by a factor of approximately 2. In spite of this large difference, the uncertainty in the overall survey results is judged to be approximately only ±25%. Notably, geographic areas in which subsistence fishing is prevalent exhibited the least evidence of over-reporting bias, while owners of personal watercraft over-reported usage to a greater extent than owners of other types of watercraft. This is consistent with the theory that recreational activities tend to be over-reported more often than non-recreational activities.

Emission estimates for recreational boating vary widely from state to state, as shown in **Table 2-5** and **Figures 2-16 and 2-17**. Louisiana, Minnesota, Missouri, and Texas account for almost 80% of the annual NO_x emissions from recreational boating in the CENRAP region, while Nebraska and Kansas combined contribute less than 4% of the total NO_x emissions. Emissions also vary widely across the months of the year, days of the week, and hours of the day, as shown in **Figures 2-18 through 2-20**. Recreational boating activity peaks during the summer months for each state, and this peak is more pronounced for the four northern states of Minnesota, Nebraska, Kansas, and Iowa. Activity peaks also occur on the weekends and during morning to midday hours.

[5] See Section 2.1.1 for a discussion of sources of information on fuels characteristics.

Table 2-5. Recreational boating emissions (tons) by state and boat type.

State	Category	PM2.5	NOx	VOC	SO2	CO	NH3

2.2.6 Assessment of Emissions from Recreational Boats

The CENRAP's emission inventory for recreational boating represents a significant improvement over existing inventories and NONROAD default activity data. Surveys of representative groups of boat owners in each of the CENRAP states made possible the replacement of NONROAD default data with state-specific information that more accurately represents recreational boating activity in the CENRAP region. The improved activity data resulted in emission estimates 2 to 4 times greater than estimates from the preliminary 2002 NEI (see **Figure 2-21**). The scale of the differences may seem surprising; however, we believe that they are reasonably accurate and reliable because care was taken to control over-reporting bias (as discussed in Section 2.2.5) and to ensure the representativeness of the survey results.

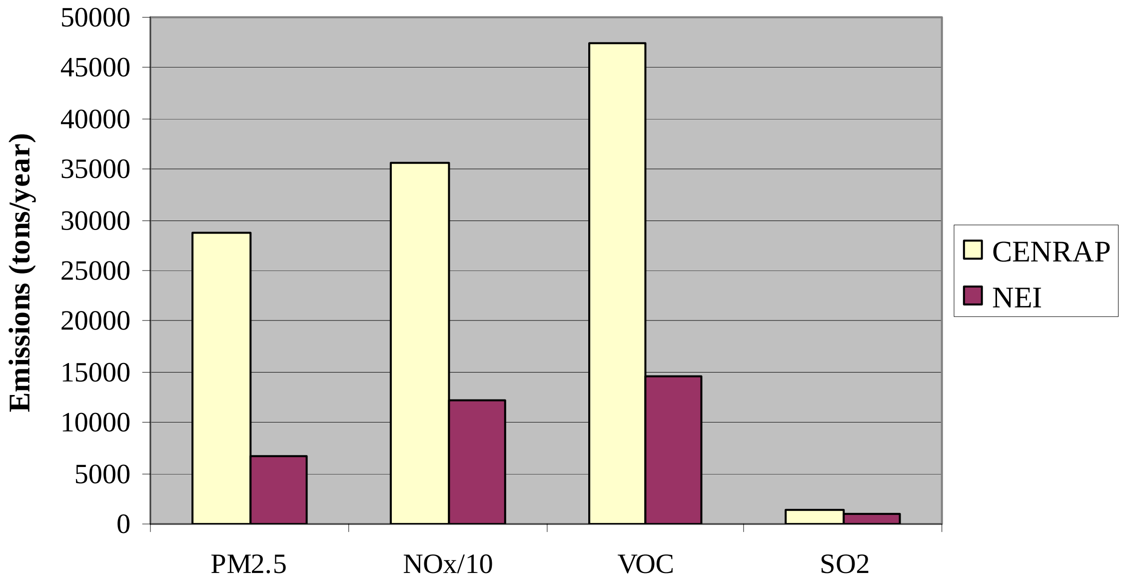

Figure 2-21. Comparison of recreational boating emissions estimates with results from the 2002 preliminary NEI (note: NO_x emissions have been divided by 10 for scaling purposes).

Figure 2-22 illustrates a county-by-county comparison of the CENRAP emission inventory with an inventory produced by running NONROAD 2004 with default inputs. The inventories differ significantly throughout the CENRAP region with respect to quantities of pollutants emitted and spatial distributions of emissions. The differences are due to the improved activity data, which were more representative of the scale and geographic distribution of recreational boating activities than NONROAD 2004 defaults. **Figure 2-23** provides a side-by-side comparison of the spatial distributions that resulted from NONROAD 2004 defaults and from the CENRAP recreational boating survey results. The CENRAP spatial allocation represents the usage patterns reported by survey respondents and is, therefore, highly representative of real-world behavior. The NONROAD spatial allocation was achieved by allocating statewide emissions proportionally to each county's water surface area. This technique overallocates emissions to areas that are unpopular with recreational boaters due to boating restrictions, remoteness from population centers, or other reasons.

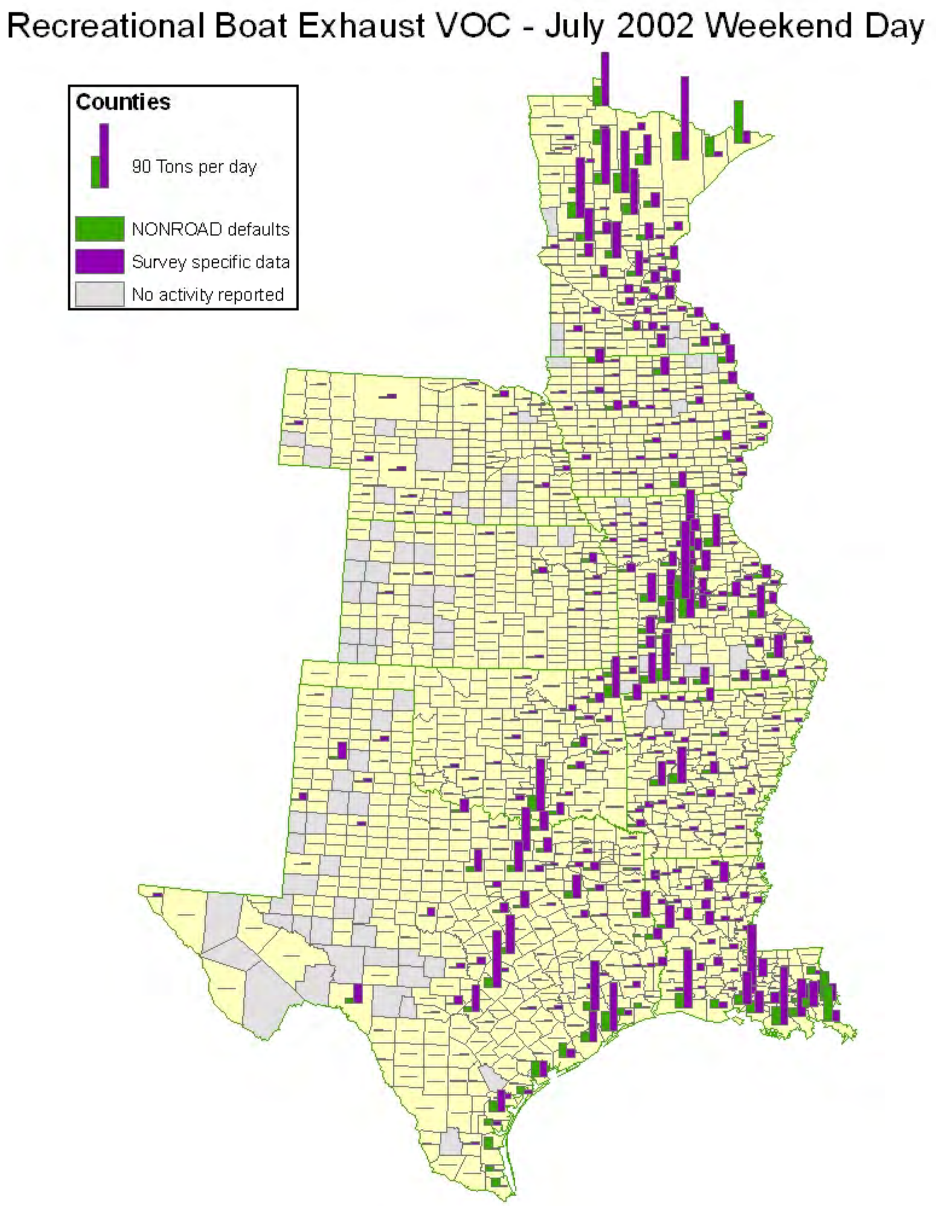

Figure 2-22. Comparison of county-level exhaust VOC emissions estimates with results obtained using NONROAD model defaults.

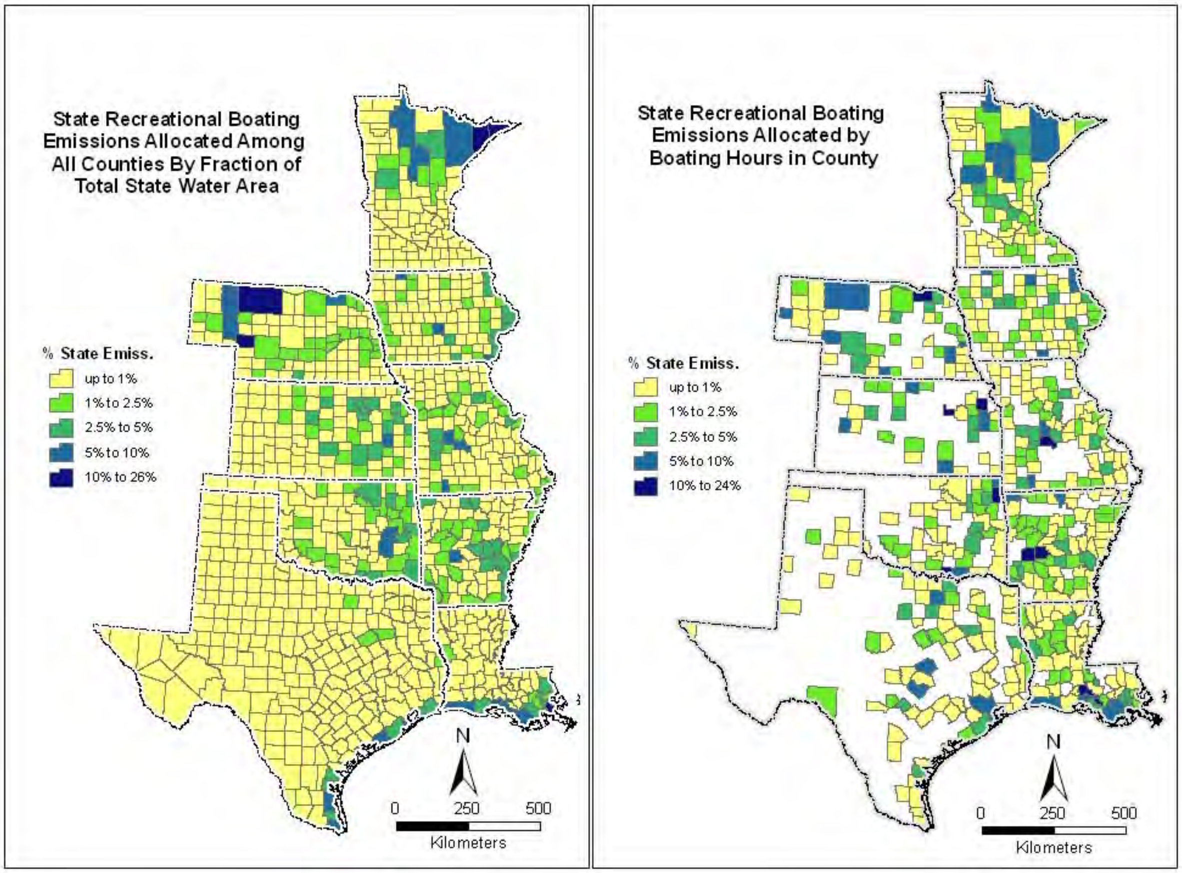

Figure 2-23. Comparison of county-level spatial allocation factors with NONROAD model defaults.

2.2.7 Summary of Emissions from Other Non-Road Mobile Sources

An initial prioritization of efforts related to non-road mobile sources indicated that commercial marine vessels, locomotives, and recreational boats represent at least two-thirds of the non-road primary and precursor emissions in counties containing or adjacent to Class I areas in the CENRAP region.[6] Therefore, these source categories were selected for bottom-up treatment, and emissions from remaining non-road mobile sources were estimated with the best available top-down methods. The EPA's NONROAD model is the approved method for estimating emissions from these sources, and the latest version of the model was run with default activity data, but with region-specific fuels characteristics and temperatures as appropriate.

Table 2-6 lists emissions for non-road mobile source categories not previously treated in earlier sections of this report—i.e., excluding emissions from locomotives, commercial marine vessels, recreational boats, and aircraft. The table lists the five largest $PM_{2.5}$ sources in each state. Agricultural equipment and construction and mining equipment, which are largely fueled

[6] The final CENRAP inventory indicates that these sources are even more substantial contributors to emissions in these areas than the initial prioritization first indicated.

by diesel fuel, tend to be the largest sources of NO_x, SO_2, and $PM_{2.5}$ for the CENRAP states, whereas recreational and lawn and garden equipment (predominantly gasoline-powered) are the largest sources of VOC. A geographic distribution of emissions for a selected date can be seen in **Figure 2-24**.

2.2.8 Assessment of Emissions from Non-Road Mobile Sources

Emissions estimates for non-road mobile sources represent an improvement over existing inventories due to the use of region-specific fuels characteristics. **Figure 2-25** shows a comparison of the CENRAP inventory and the preliminary 2002 NEI. A significant difference in SO_2 emissions and a modest difference in VOC emissions are apparent. These differences are due to the use of state-specific diesel sulfur contents and gasoline volatilities for the CENRAP inventory. However, further improvements could be made by gathering bottom-up activity data (as was done for recreational boating). Based on a review of the emissions totals, the priority categories for further study are agricultural equipment and construction and mining equipment, which account for 75% of the total NO_x, $PM_{2.5}$, and SO_2 emissions from "other" non-road mobile sources and/or recreational or lawn and garden equipment, which dominate VOC emissions.

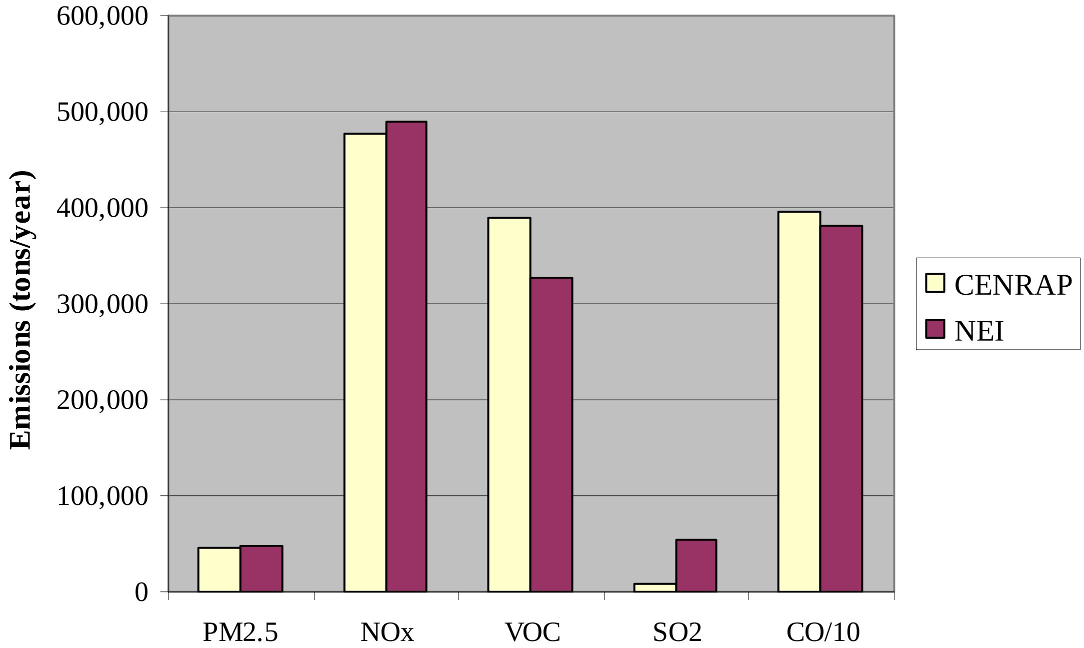

Figure 2-25. Comparison of non-road mobile source emissions with results from the preliminary 2002 NEI (note: CO emissions have been divided by 10 for scaling purposes).

2.3 EMISSIONS FROM SOURCES OF AGRICULTURAL DUST

2.3.1 Summary of Emissions from Agricultural Tilling Operations

Particulate matter (PM) emissions from agricultural tilling operations in the CENRAP region were estimated combining a constant emission factor with county-level activity data, including the silt content of surface soils, the number of tillings performed in a year for each crop type, the acres of each crop type, and information about conservational tillage practices. (Conservational tilling practices, such as no-till, mulch-till, and ridge-till, reduce the number of tilling passes performed in a year.) Total PM_{10} emissions from agricultural tilling operations in the CENRAP region were estimated to be over 1.3 million tons per year, with $PM_{2.5}$ emissions contributing about 270,000 tons to this total (see **Table 2-7** and **Figure 2-26**). A geographic distribution of county-level $PM_{2.5}$ emissions appears in **Figure 2-27**. Temporal variations in $PM_{2.5}$ emissions by month, day-of-week, and hour-of-day appear in **Figures 2-28 through 2-30**.

Table 2-7. Particulate matter emissions (tons) from agricultural tilling operations by state.

State	PM_{10}	$PM_{2.5}$
Arkansas	87,895	17,579
Iowa	236,520	47,304
Kansas	253,850	50,769
Louisiana	42,443	8,489
Minnesota	215,070	43,013
Missouri	104,530	20,905
Nebraska	138,850	27,770
Oklahoma	100,160	20,033
Texas	167,420	33,484
Total	1,346,738	269,346

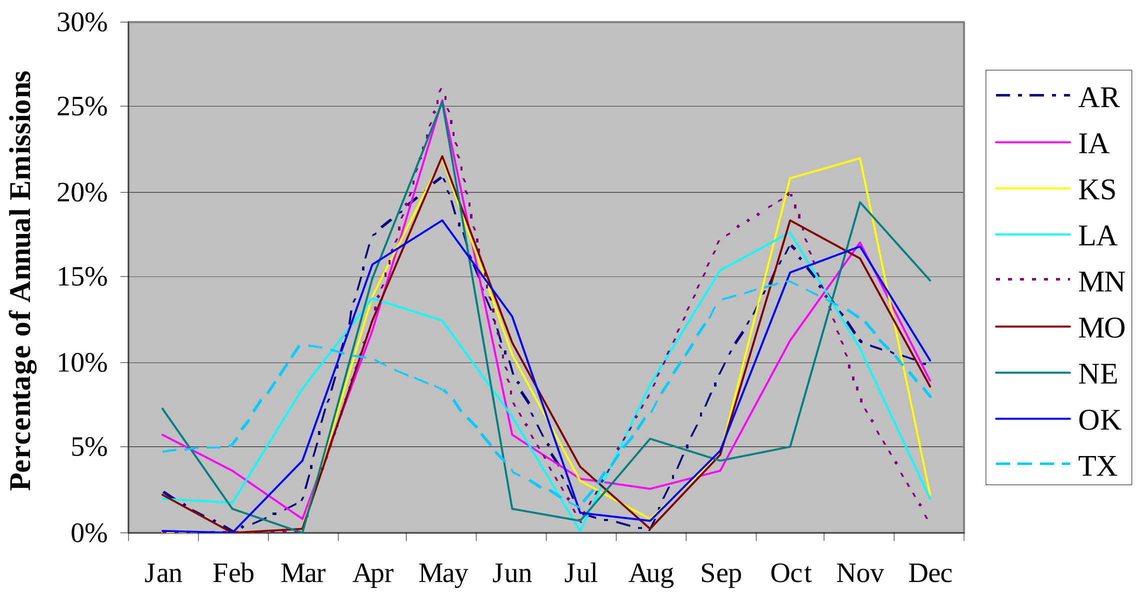

Figure 2-28. Monthly variability in agricultural tilling emissions by state.

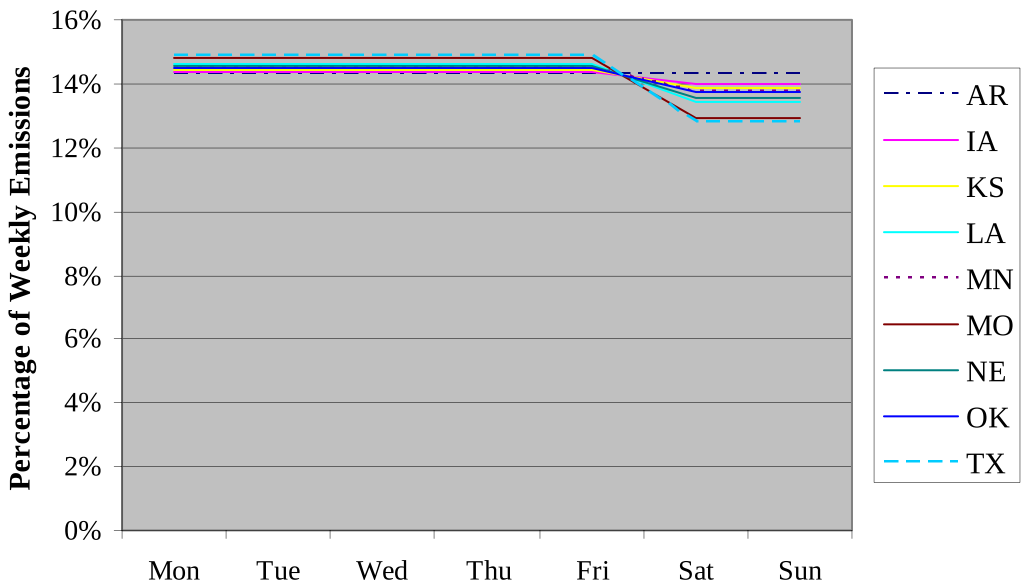

Figure 2-29. Day-of-week variability in agricultural tilling emissions by state.

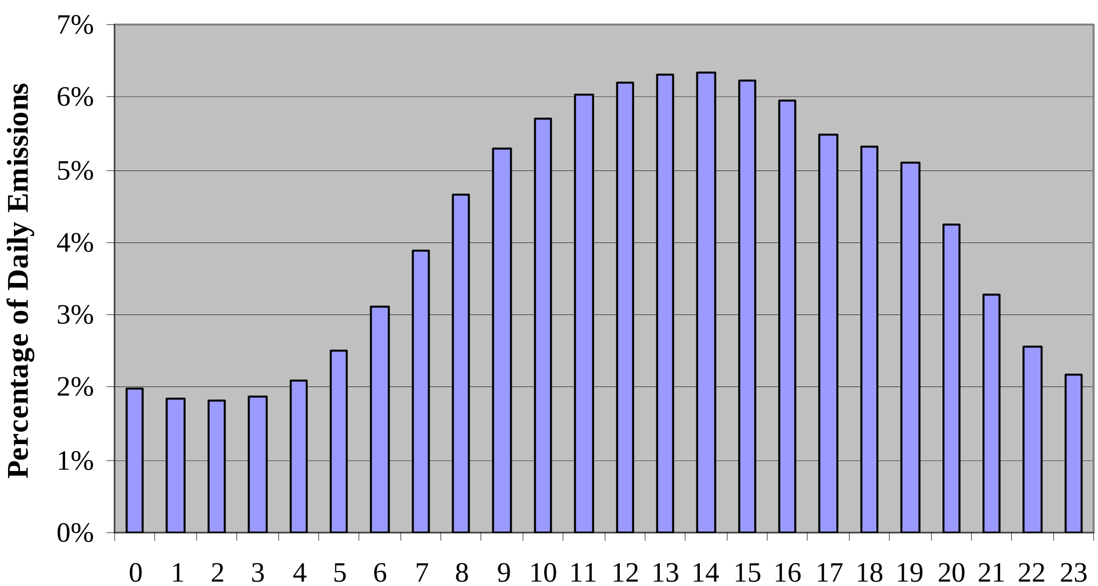

Figure 2-30. Diurnal variability in agricultural tilling emissions (same for all states).

2.3.2 Assessment of Emissions from Agricultural Tilling Operations

The use of locally representative activity information in the development of emission inventories for agricultural tilling operations permitted a significant improvement over the inventory compiled for the preliminary 2002 NEI. The most significant improvements included county-level soil silt contents and locally reported tilling practices (reported as the number of

tilling passes completed for each crop type), which were found to correlate with the actual prevalence of conservational tilling practices. Emission estimates from this inventory are generally about 25% to 30% lower than corresponding estimates from the preliminary 2002 NEI, although the comparison varies from state-to-state (see **Figure 2-31**). These reductions seem primarily due to the incorporation of local information on tilling practices because the reported number of tilling passes for each crop type was often less than indicated by EPA guidance. A likely explanation is that conservational tilling practices have become more prevalent in recent years, particularly in Texas, where the most dramatic differences between the preliminary 2002 NEI and the CENRAP inventory are apparent.

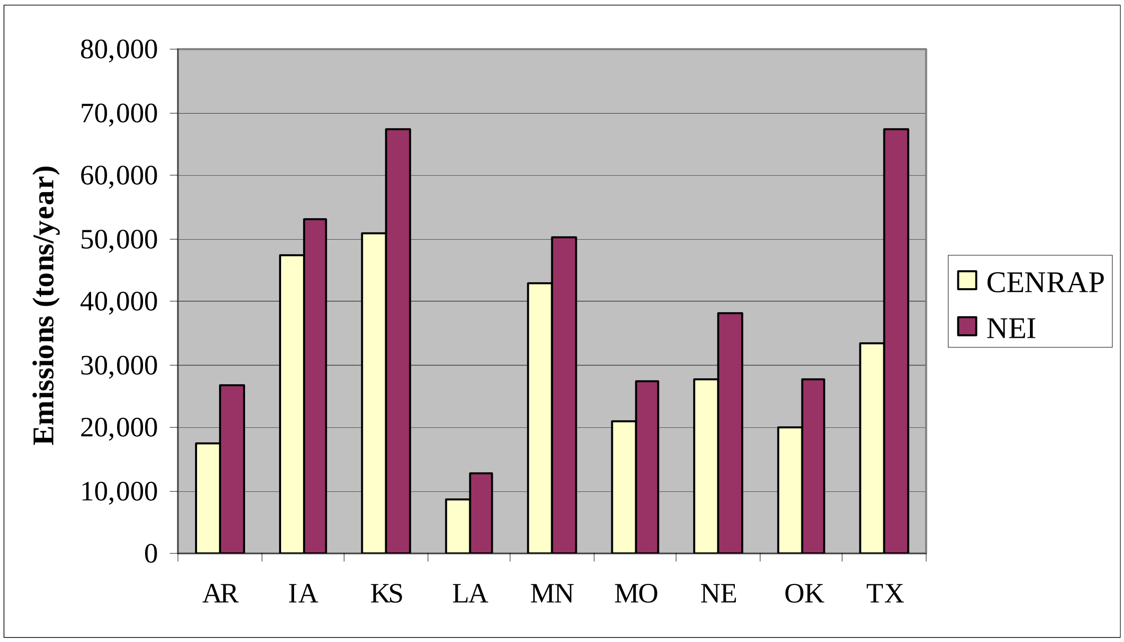

Figure 2-31. State-by-state comparison of $PM_{2.5}$ emissions from agricultural tilling operations.

2.3.3 Summary of Emissions from Livestock Operations

PM emissions from livestock operations in the CENRAP region were estimated using a PM_{10} emission factor and a $PM_{2.5}$ size fraction selected after a literature review. These factors were applied to facility-specific annual populations for beef cattle feedlots and dairies. Because facility locations were also acquired, emissions from livestock operations were treated as point sources and assigned to the specific location coordinates of each facility. Total PM_{10} emissions from livestock operations in the CENRAP region were estimated to be 51,000 tons per year, with $PM_{2.5}$ emissions contributing about 7,700 tons to this total (see **Table 2-8** and **Figure 2-32**). A geographic distribution of county-level PM_{10} emissions appears in **Figure 2-33**.

Table 2-8. Particulate matter emissions (tons) from livestock operations by state.

State	Facility Type	PM_{10}	$PM_{2.5}$
Arkansas	Beef Cattle Feedlot	0.0	0.0
	Dairy	3.9	0.6
Iowa	Beef Cattle Feedlot	4,314.0	647.1
	Dairy	40.8	6.1

Total		51,290.2	7,693.6

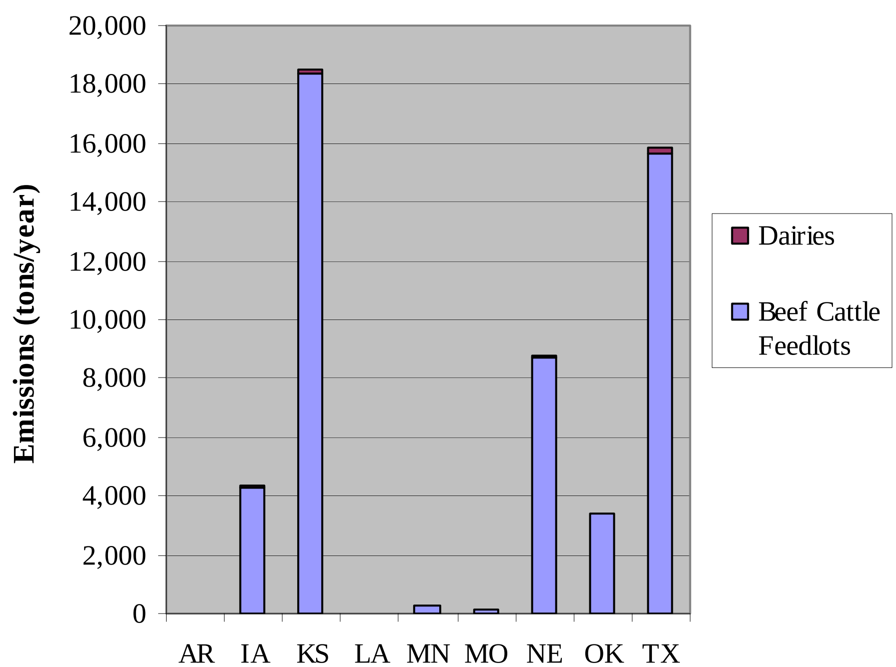

Figure 2-32. PM_{10} emissions from livestock operations by state and facility type.

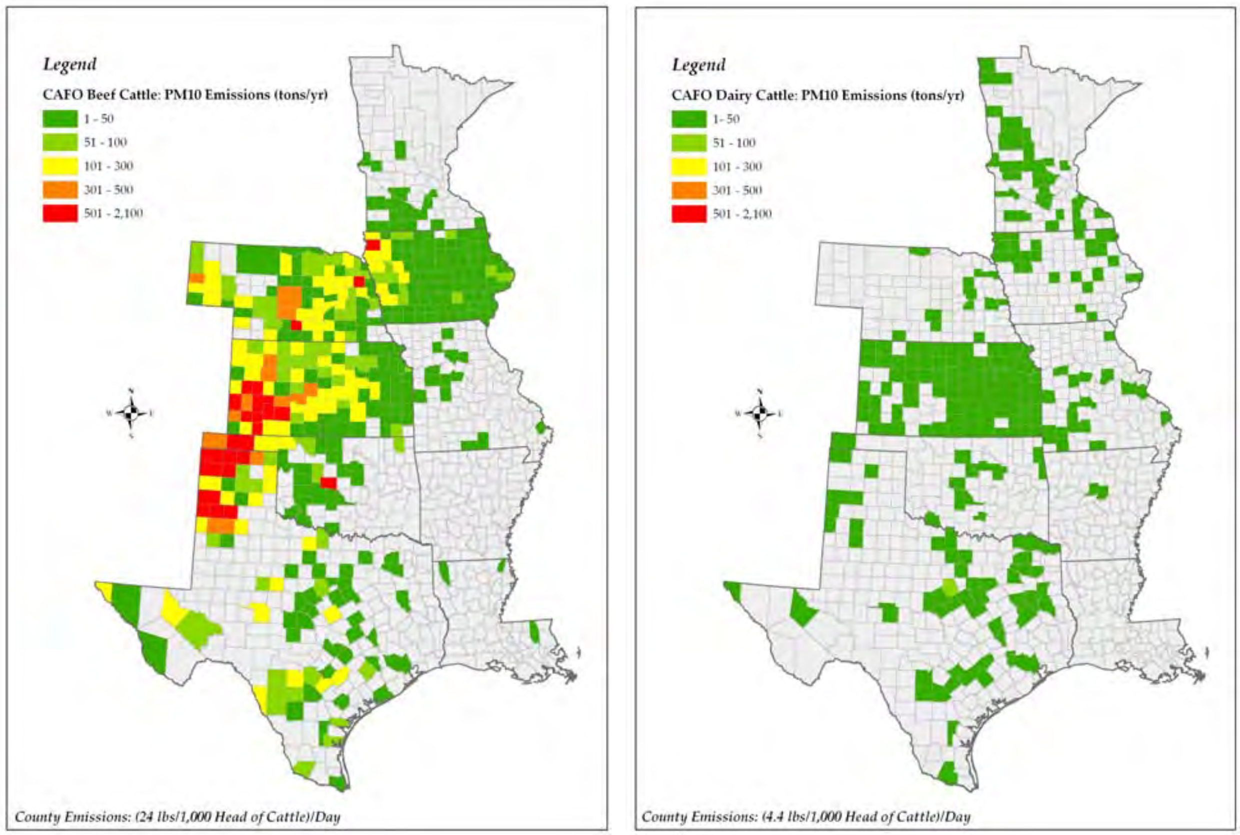

Figure 2-33. County-level PM_{10} emission estimates for beef cattle feedlots (left) and dairies (right).

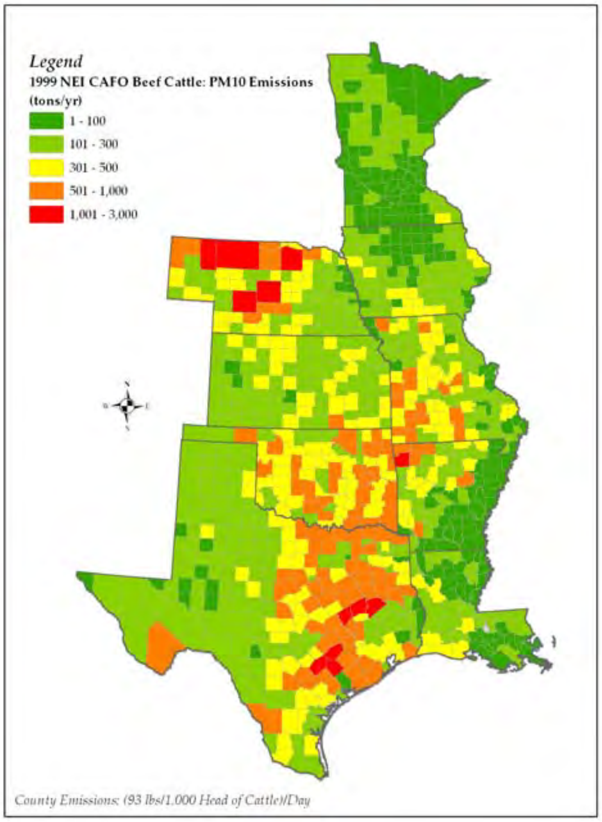
2.3.4 Assessment of Emissions from Livestock Operations

The methods used to develop emission inventories for livestock operations represent a significant improvement over existing inventories, both in terms of the total annual emissions calculated and the geographic distribution of those emissions. The 1999 NEI[7] included an estimated 270,000 tons per year of PM_{10} emissions from CAFOs in the CENRAP region—a figure more than five times higher than that estimated for the CENRAP inventory. A literature search indicated that the emission factor of 17 tons per 1000 animals per year, which was used during development of the 1999 NEI, was too high for this source category. Ultimately, an emission factor of 4.4 tons per 1000 animals per year was selected for beef cattle and an emission factor of 0.8 tons per 1000 animals per year was used for dairy cows.

In addition, the use of facility coordinates greatly enhanced the spatial distribution of emissions. For the 1999 NEI, a simplifying assumption was used that the number of cattle housed at CAFOs is approximately 10% of the total number of beef cattle in each county, regardless of feedlot locations or local animal husbandry practices. As a result, emissions were assigned to many counties in which no feedlots operate, as illustrated by **Figure 2-34**, which

[7] Particulate emissions from animal feedlots are not yet included in the 2002 version of the NEI.

contrasts the geographic distribution of emissions in the 1999 NEI with known feedlot locations and animal populations. Side-by-side comparison of these figures shows that the 1999 NEI registers high emissions densities in eastern Texas, Oklahoma, western Missouri, and northwestern Nebraska—areas where very few CAFOs exist. In reality, most CAFOs in the CENRAP region accumulate in a band that reaches from the Texas panhandle, across Kansas and southeastern Nebraska, and across the state of Iowa.



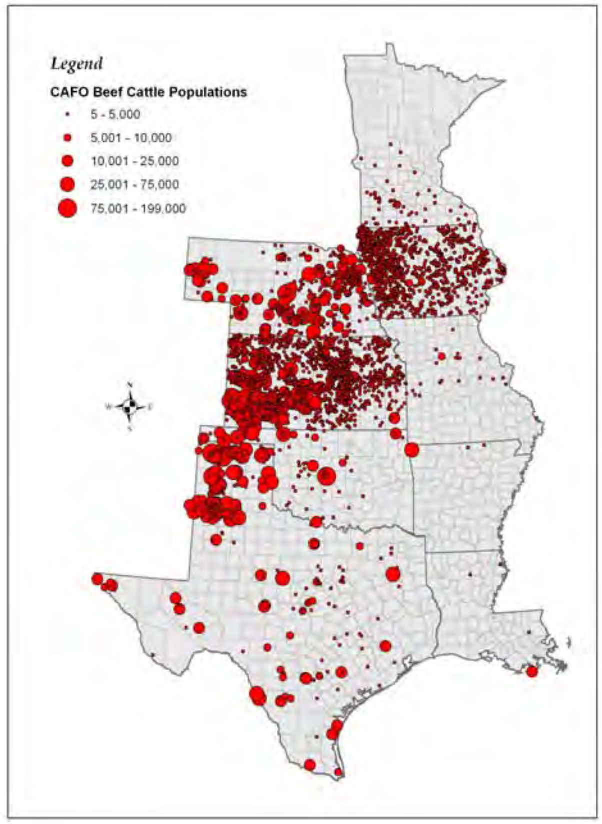


Figure 2-34. NEI county-level PM_{10} emissions for beef cattle feedlots vs. actual beef cattle feedlot locations and populations.

3. RECOMMENDATIONS FOR FURTHER RESEARCH

This study resulted in significant improvements to the 2002 emission inventories for on-road and off-road mobile sources and for sources of agricultural fugitive dust in the CENRAP region. Emission inventories were prepared on highly region-specific or even county-specific bases and adhered closely to EPA's recommended guidance for inventory development. Additional refinements and improvements should be incorporated as the products of ongoing research into emission factors and updates to activity data sets become available. Additionally, we identified the following potential sources of uncertainty in the inventories (roughly in order of importance):

1. Unusual vehicle age distributions and duplicate VIN records were observed in DMV databases of vehicle registrations.
2. The inventories of non-road mobile sources could benefit from additional bottom-up data collection efforts.
3. Existing VMT distributions could be refined to better represent the increasing popularity of SUVs and light trucks.
4. Fuels testing programs could be deployed or improved to better represent fuels characteristics.
5. VIN decoding yielded too few records corresponding to alternative-fueled vehicles to allow improvements to this component of the inventory (though this affects future-year projections more than the 2002 inventory).
6. Day-specific inventories (e.g., Monday, Tuesday, etc.) may be superior to assuming all weekdays are the same and both weekend days are the same for photochemical modeling purposes.
7. The inventories of agricultural fugitive dust sources could benefit from additional bottom-up data collection efforts.

This section briefly discusses recommendations for addressing these issues.

3.1 RECOMMENDATIONS FOR IMPROVING INVENTORIES OF ON-ROAD MOBILE SOURCES

3.1.1 Incorporate New Data and Information as They Become Available

Emission inventories operate best as dynamic databases—subject to continuous refinements, additions, and improvements as research develops and activity data are updated. The electronic file systems of the activity data and emission inventories developed for the CENRAP, which were delivered as products of this project, are likely to be revised and improved as new information becomes available. Examples of recently developed or soon-to-be-available data sets that could be incorporated to further improve the CENRAP's inventories include (1) locally generated VMT estimates for Kansas City, Minneapolis-St. Paul, and Little

Rock; (2) results of the fuels testing program of the Texas Department of Agriculture; and (3) reports of fuels sulfur contents that refiners will be submitting to EPA beginning in February 2005 for diesel and February 2007 for gasoline. In addition, we recommend encouraging fuel testing programs in states where they are not yet planned—Louisiana, Arkansas, Iowa, and Nebraska—and encouraging the Oklahoma Department of Agriculture to archive and maintain records of their existing fuels testing program.

3.1.2 Investigate Databases of Vehicle Registrations

Unusual features in several states' databases of vehicle registrations were noted, including (roughly in order of importance) unexpected numbers of duplicate VINs, unusually large proportions of old light-duty vehicles, and unexpectedly small numbers of light-duty vehicles less than 2-3 years in age. High frequencies of duplicate VINs are sources of error in fleet distributions in and of themselves—particularly in Iowa, where the frequency of duplicates could only be reduced to 6%. However, high frequencies of duplicate records may only be one symptom of general database maintenance problems—such as retention of outdated records, mis-assignment of records, etc.—that cannot be easily recognized and remedied without in-depth review and diagnosis. The possibility that unidentified errors in the vehicle registration databases are related to unusual vehicle age distributions in some states is a cause for concern. MOBILE6 models older vehicles with higher emission rates due to their levels of deterioration and outdated emissions control technologies. Therefore, errors in this component of the vehicle population distributions exert significant impacts on the emission inventories of on-road mobile sources. In addition, errors across all age ranges can significantly impact projections of emission inventories to future years.

3.1.3 Use Fleet Distributions to Refine VMT Distributions

Patterns of SUVs and light-duty-truck use have been shifting rapidly in recent years. However, for this study, VMT distributions by vehicle type for many areas of the CENRAP were based on EPA defaults, which are based on predictions and data from a number of years ago. Errors in the VMT distributions by vehicle type can be significant because emissions standards vary across the classes of light-duty vehicles, and emissions from gasoline-fueled vehicles differ considerably from those of diesel-fueled vehicles. VMT distributions could be refined or adjusted by using vehicle registration data. This approach is based on an assumption, which we believe is well-founded, that due to recent trends in vehicle ownership and driver behavior, many light-duty trucks (e.g., SUVs) are now driven very similarly like passenger vehicles. Thus, the proportions of VMT that should be assigned to each vehicle type and fuel type are approximately equal to the proportions of vehicles registered in each vehicle- and fuel-type category. (Note that this assumption has already been applied in EPA Region I.) Alternatively, the VMT mix could be calculated from registration data using the vehicle type-specific assumptions about annual mileage accumulation rates that are part of the MOBILE6 model.

3.1.4 Prepare Inventories Specific to the Days of the Week

Driving activities for on-road motor vehicles appear to vary with each day of the week. Therefore, a day-specific approach may be preferable to a simple weekday-weekend approach for some photochemical modeling applications. In general, urban VMT declines on Sundays below average weekday levels to an even greater extent than on Saturdays. Friday evening VMT is somewhat higher than on other weekday evenings, and daily total VMT on Mondays is usually somewhat below average for weekdays in urban areas. Day-specific patterns are also likely to occur in rural areas. The 2002 CENRAP inventories reflect the most significant weekday-weekend patterns supported by research results from other areas of the United States. However, further improvements could be made by investing in research projects that investigate region-specific, day-of-week patterns for both rural and urban areas.

3.1.5 Improve Inventories for Alternative-Fueled Vehicles

VIN decoding yielded too little information to support improvements to the inventory of alternative-fueled vehicles. In addition, fuels characteristics of alternative fuels are rarely tested, and no region-specific data were identified. While these uncertainties have little effect on the 2002 inventory, they may become more important when future-year emission inventories are projected to 2018 and beyond. Alternative-fueled vehicles may compose significantly larger proportions of vehicle fleets in the future and trace levels of sulfur in alternative fuels may become more important as sulfur levels in diesel and gasoline fuels continue to decline as a result of existing regulations.

3.2 RECOMMENDATIONS FOR IMPROVING INVENTORIES OF NON-ROAD MOBILE SOURCES

A survey of representative groups of recreational boat owners in the CENRAP region produced dramatic revisions to the emission inventories for this source category. Emissions estimates were revised by factors of 3 or more, on average. Further improvements in the non-road component of the inventory could be made by gathering bottom-up activity data for the next-largest non-road mobile source categories, including agricultural equipment and construction and mining equipment (which are significant sources of NO_x, $PM_{2.5}$, and SO_2 emissions) and/or recreational or lawn and garden equipment (which are important sources of VOC emissions).

3.3 RECOMMENDATIONS FOR IMPROVING INVENTORIES OF SOURCES OF AGRICULTURAL DUST

3.3.1 Research and Develop Process-Based Emissions Estimation Methods

The limited body of research into emission factors and emission processes represents the most significant weakness in the emission inventories of sources agricultural fugitive dust. Investment in the development of emissions measurement programs and process-based

approaches that account for soil moisture, meteorological conditions, and agricultural practices would produce substantial improvements to the accuracy and certainty of this component of the inventory.

3.3.2 Prepare Bottom-Up Inventories for Additional Source Categories

A survey of agricultural extension offices and the use of bottom-up animal population data produced significantly altered spatial allocations and emissions estimates for sources of agricultural fugitive dust. State-level emissions estimates were revised by 25% to 50%, and CAFO emissions were displaced to entirely different geographic areas of the CENRAP. Further modest improvements could be made by gathering bottom-up activity data for the next-largest sources of agricultural fugitive dust, including cotton ginning operations and/or crop transport. However, emissions from these types of sources are likely to be dwarfed by emissions from agricultural tilling dust and are likely to be of significance in only a few areas of the CENRAP where cotton ginning occurs.

1. INTRODUCTION

The Central States Regional Air Planning Association (CENRAP) is developing a regional haze plan in response to the U.S. Environmental Protection Agency's (EPA) mandate to protect visibility in Class I areas. To develop an effective regional haze plan, the CENRAP ultimately must develop a conceptual model of the phenomena that lead to episodes of low visibility in the CENRAP region. Thus, the CENRAP is researching visibility-related issues for its region, which includes the states of Texas, Oklahoma, Louisiana, Arkansas, Kansas, Missouri, Nebraska, Iowa, and Minnesota. Both primary particulate matter (which is emitted directly to the atmosphere in particulate form) and the formation of secondary particulate matter (which is generated from chemical transformations in the atmosphere of gaseous precursor species such as ammonia, nitrogen oxides, sulfur oxides, and volatile organic compounds [VOCs]) contribute to episodes of regional haze and low visibility in the CENRAP region. Mobile sources and sources of agricultural fugitive dust are thought to be significant sources of these pollutants (as illustrated in **Figure 1-1**). In recognition of these issues, the CENRAP sponsored the development of improved emission inventories for mobile sources and sources of agricultural dust. The project objectives were to improve or develop activity data for off- and on-road mobile sources and sources of agricultural dust throughout the nine CENRAP states; to prepare the activity data in formats compatible for reprocessing and use with MOBILE6, NONROAD, and SMOKE 1.5 (which runs MOBILE6 internally); and/or to prepare the emission inventories in the latest version of the National Emission Inventory Input Format (NIF).

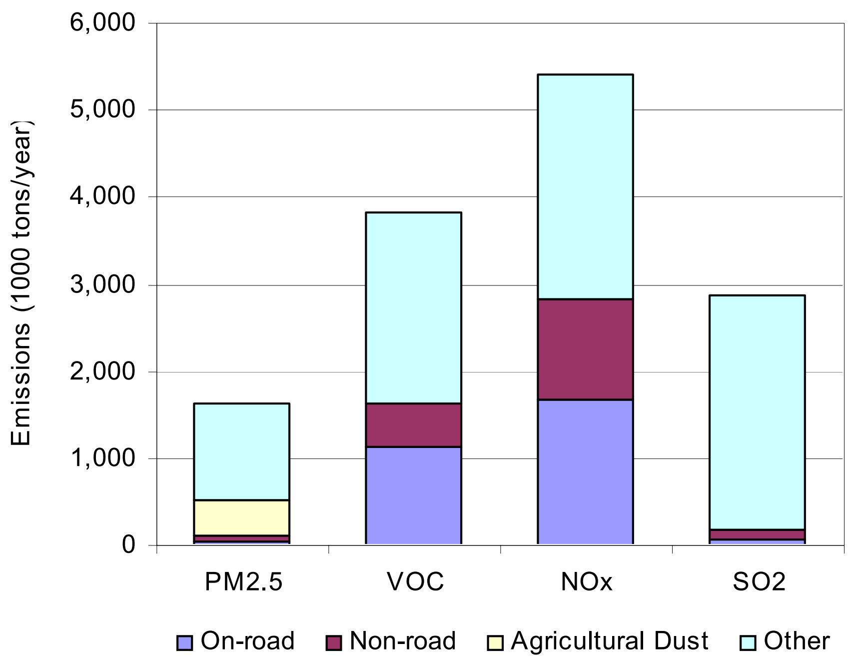

Figure 1-1. Estimated emissions for the CENRAP region. Source: 1999 NEI (U.S. Environmental Protection Agency, 1999c).

1.1 BRIEF OVERVIEWS OF EMISSIONS MODELING METHODS

1.1.1 Overview of Methods to Prepare Emission Inventories of On-Road Mobile Sources

The EPA's MOBILE6 model—an emission factor model that estimates emission factors for on-road mobile sources—and SMOKE were used to generate and prepare emission inventories of on-road mobile sources for photochemical modeling. SMOKE processes and prepares on-road mobile source emission inventories for photochemical air quality modeling by applying temporal profiles, speciation profiles, and gridding surrogates to county-level emissions estimates. In addition, SMOKE self-contains MOBILE6. Thus, SMOKE has the added capability of generating county-level emission inventories for on-road mobile sources by estimating MOBILE6 emission factors and matching these to county-level activity data. MOBILE6 requires a variety of inputs, including temperatures, fleet distributions, vehicle speeds, regulatory controls settings, and fuels characteristics. **Figure 1-2** illustrates the general processes of using MOBILE6 within SMOKE to generate on-road mobile source emission inventories. Figure 1-2 also illustrates the MOBILE6/SMOKE activity data, input files, and outputs that were prepared as products of this project. The products of these inventory development efforts are highly region-specific, or even county-specific, emission inventories that adhere to EPA's recommended guidance for the development of emission inventories for on-road mobile sources.

1.1.2 Overview of Methods to Prepare Emission Inventories of Non-Road Mobile Sources

The EPA's NONROAD model was used to estimate emissions for most non-road mobile sources. The NONROAD model applies equipment populations, activity data (e.g., hours of operation, load factors, etc.), emission factors, and growth factors to estimate emissions for non-road mobile sources. Default input files accompany the model, which are sufficient to estimate emissions for the entire United States at the county level. However, many of the default values are based on national defaults or general assumptions and can be improved with region-specific data, if available. Improved activity data were collected throughout the CENRAP region for recreational boating, which is considered to be one of the most important non-road mobile source categories in the region. These efforts resulted in emission inventories that are much improved over those generated by using the national default values. The most significant improvements included the hours of operation, load factors, spatial distributions, and temporal patterns of recreational boating.

Emissions from locomotives and commercial marine vessels, which are excluded from the NONROAD model, were estimated according to EPA guidance documents and using bottom-up activity data to the extent available. Aircraft emissions, which are also excluded from the NONROAD project, were considered to be a lower priority and were not included in the scope of this project.

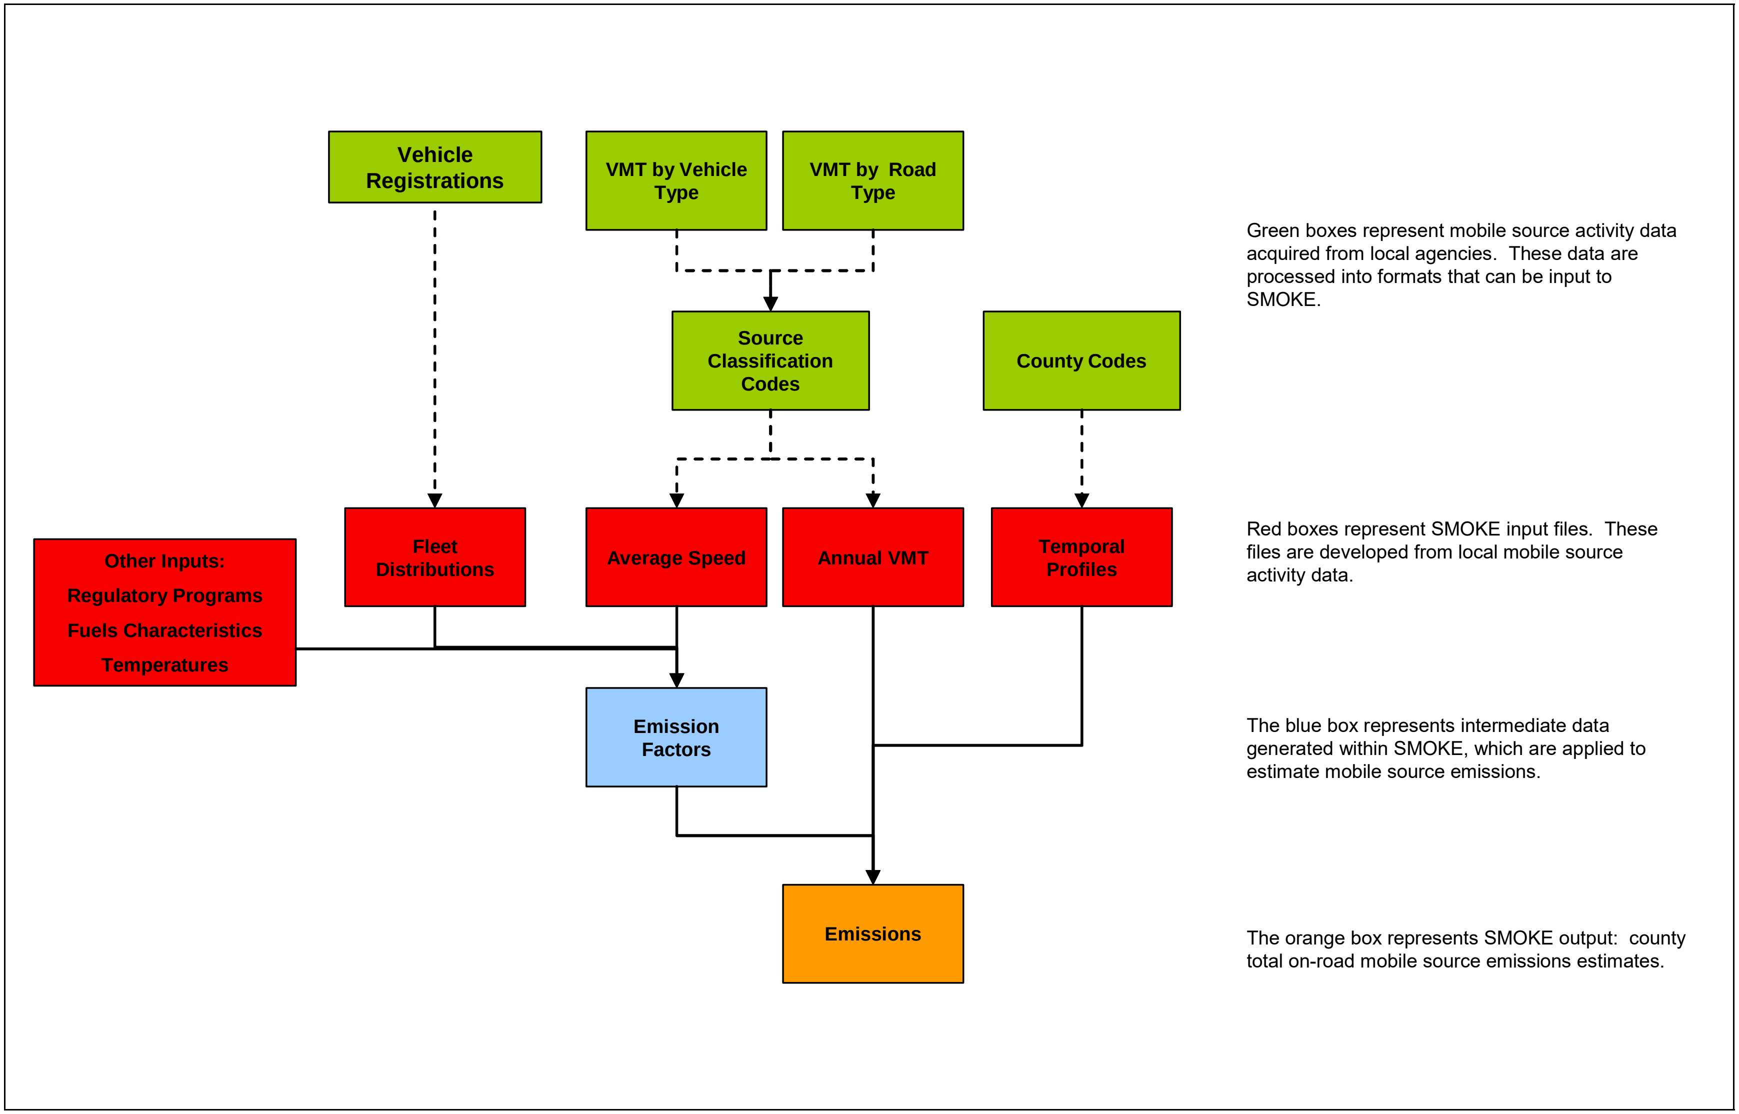

Figure 1-2. General illustration of the overall process and files used by SMOKE to generate on-road mobile source emissions output files.

1.1.3 Overview of Methods to Prepare Emission Inventories for Sources of Agricultural Dust

Emissions from agricultural fugitive dust sources were estimated according to EPA guidance documents or published literature. Bottom-up activity data were used to the extent available, including facility-specific animal populations for confined animal feeding operations (CAFOs) and activity data to describe agricultural tilling operations. Up-to-date GIS databases of soil characteristics and crop types were also used to improve the inventories. These activity data represent a significant improvement over inventories developed by applying national default assumptions. The most significant improvements include the CAFO animal populations, the geographic distributions of CAFO populations, the estimates of the number of tilling passes completed for each crop type, the representative soil silt content for each county, and the temporal patterns of agricultural tilling activities.

1.2 IMPORTANT ASSUMPTIONS

The methods employed to estimate emissions relied on several fundamental assumptions:

- Monthly fuel consumption data from the Federal Highway Administration (FHWA) and Energy Information Administration are representative of monthly patterns of on-road motor vehicle activity.
- Day-of-week and diurnal patterns of on-road motor vehicle activities observed in rural and urban geographic areas of the United States (such as Texas, California, or the national average) are reasonably representative of urban and rural areas of the CENRAP region.
- Rail link-specific traffic density data (ton-miles of cargo moved) is a reasonable surrogate for allocating locomotive fuel usage to the county level.
- The characteristics and speeds of marine vessels at key ports in the CENRAP region can be extrapolated to other ports for which detailed vessel data are not available.

Surveys were conducted to collect bottom-up information for recreational boating and agricultural dust source categories. In those cases, it was assumed that

- Recreational boat owners were capable of providing survey responses that could be interpreted to reasonably represent recreational boating activities across the CENRAP region. Techniques to eliminate or minimize the effects of over-reporting biases were sufficient.
- County agricultural extension service agents were capable of providing survey responses that reasonably represent agricultural tilling activities in the CENRAP region.
- In some cases, incomplete data were recovered. Thus, extrapolation or aggregation of bottom-up observations was assumed to produce reasonably representative results when data were missing, incomplete, or uncertain. A few examples of affected data sets include age distributions for vehicle types that appear with very low frequencies in the vehicle population, reported numbers of tilling passes for rarely grown crop types,

reported hours of use for recreational boats with inboard motors, and others as discussed in the main body of the Final Report.

- Lastly, we relied on state motor vehicle departments' databases of vehicle registrations to represent the 2002 vehicle populations in each county. In some cases, unusual features in vehicle distributions appeared (e.g., larger than expected populations of old vehicles), but no reasons to discount these phenomena could be determined.

2. METHODS TO PREPARE ACTIVITY DATA FOR ON-ROAD MOBILE SOURCES

This section describes the information sources used and the data processing steps followed to prepare activity data for on-road mobile sources, including vehicle miles traveled (VMT), speed distributions, and temporal distributions. VMT, speed distributions of VMT, and temporal distributions of VMT are critical input variables for emission inventories of on-road mobile sources and photochemical air quality models. VMT is a measure of on-road vehicle activity, which is often used as the foundation of emission inventories of on-road mobile sources, including those prepared with MOBILE6. Speed distributions of VMT significantly affect emission rates, while the timing of vehicle activities by season, day, or hour also significantly influences emissions (which vary with temperature).

The SMOKE emissions processor uses VMT, distributions of VMT by speed bin, and temporal distributions of VMT to estimate on-road motor vehicle emissions and to prepare emission inventories for use with photochemical air quality models. The objective of this task was to develop the SMOKE inputs for the CENRAP domain, including county-level VMT, speed distributions, and temporal profiles, which were used to model and prepare emission inventories of on-road mobile sources for the year 2002 (as discussed in Section 8).

2.1 BACKGROUND AND TECHNICAL ISSUES

The FHWA maintains the Highway Performance Monitoring System (HPMS) database, which contains estimates of VMT for all U.S. states and counties. The HPMS database is updated periodically with VMT data submitted by states. However, VMT data developed at the local or state level are preferable because they generally better represent regional or local conditions, are often more current than the data in the HPMS database, and, therefore, result in better quality emissions inventories. Therefore, locally or regionally developed mobile source activity data were given preference, were acquired whenever available from state and local transportation or air quality management agencies, and were used preferentially over the national default VMT estimates.

The availability of local- or state-level data varied geographically within the CENRAP domain and depended on the area's attainment status and level of urbanization. **Figure 2-1** depicts non-attainment areas, urban attainment areas, Class I areas, and tribal lands in the CENRAP region. Areas for which data existed at the local level included five non-attainment areas, which had previously performed emissions modeling with MOBILE6 or MOBILE5, as well as some urban attainment areas. Although none of the urban attainment areas had prepared VMT for emissions modeling, most had VMT data for transportation planning purposes. Thus, for all non-attainment and most urban attainment areas, locally developed VMT, speed distributions, and temporal distributions were acquired. For all other areas (i.e., rural attainment areas and some urban attainment areas), data that had been developed at the state level were acquired.

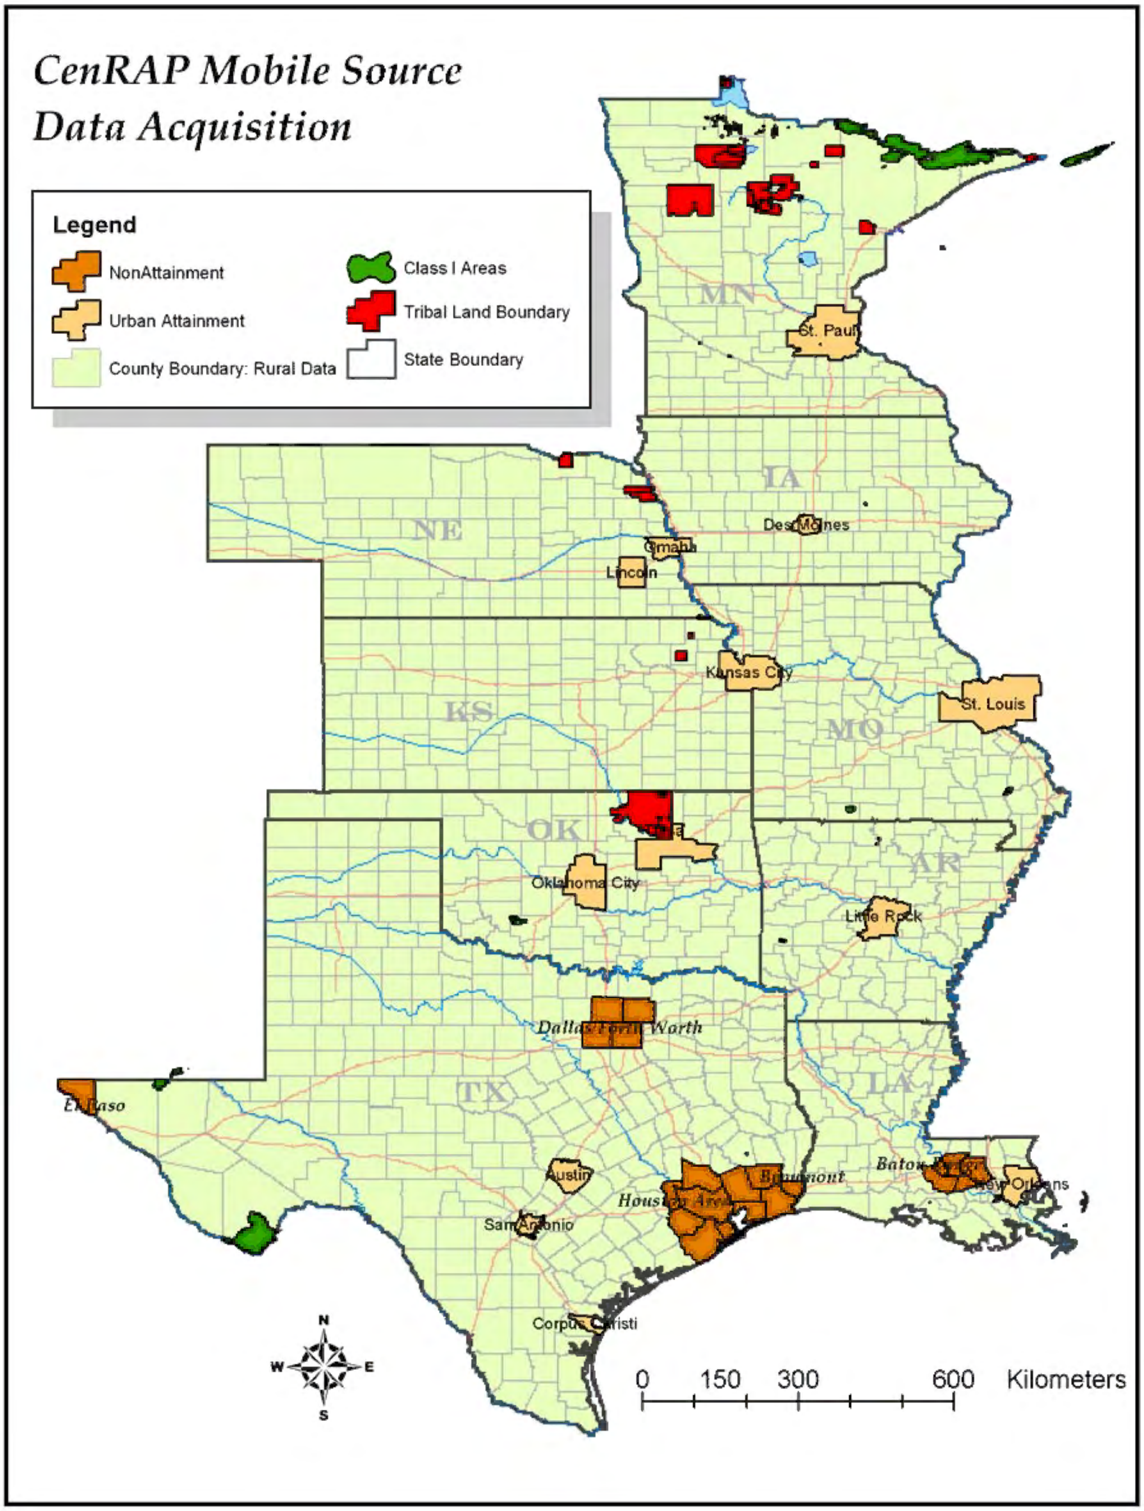

Figure 2-1. Non-attainment areas, urban attainment areas, Class I areas, and tribal lands in the CENRAP region.

To ensure effective use of project resources, we identified areas to be given highest priority according to the following criteria:

1. Magnitude of each region's VMT, population, and proximity to Class I areas.
2. Availability of MOBILE input data.
3. Availability of state or local mobile source activity data to represent the year 2002.

2.2 DATA ACQUISITION

Urban areas often maintain state-generated or locally generated VMT and speed or temporal distributions for the purposes of emissions assessments, air quality modeling, or transportation planning. In addition, the FHWA maintains the national Highway Performance Monitoring System (HPMS) database of VMT on major U.S. roadways. The HPMS data are reported at the county or sub-county level by road type (i.e., freeway, highway, major arterial).

Sonoma Technology, Inc. (STI) requested locally developed on-road mobile source activity data for all non-attainment areas in the CENRAP region and for urban attainment areas located near Class I areas. When locally developed mobile source activity data were not available, Metropolitan Planning Organizations (MPOs) and state departments of transportation (DOTs) were contacted with requests for data. For all other areas, state DOTs were contacted for the most up-to-date HPMS data. **Table 2-1** summarizes the mobile source activity data acquired for each area of the CENRAP domain.

Table 2-1. Summary of the on-road mobile source activity data acquired for each area of the CENRAP domain.

Page 1 of 3

Area	Data Acquired	Year	Source of Data
Non-Attainment Areas			
Houston/Galveston, Beaumont/Port Arthur, and El Paso, Texas	MOBILE6 input files, VMT by vehicle/road type, temporal/speed distributions	2002	Texas Transportation Institute (TTI)
Dallas/Forth Worth, Texas	VMT by vehicle/road type, temporal/speed distributions	1999	Texas Commission on Environmental Quality (TCEQ)
Baton Rouge, Louisiana	MOBILE6 input files, VMT by road type	2002	Louisiana Department of Environmental Quality (LDEQ)

Missouri	VMT by road type	2002	MoDOT
Nebraska	VMT by road type	2002	Nebraska Department of Transportation
Oklahoma	VMT by road type	2002	OSHD

2.2.1 Details of Data Acquisition for Non-attainment Areas

The CENRAP region currently has five non-attainment areas: four in Texas and one in Louisiana. The El Paso, Texas, non-attainment area (designated as serious) consists of El Paso County and is within about 150 km of the Guadalupe Mountains and Carlsbad Caverns National Parks and within about 400 km of Big Bend National Park. The Dallas-Ft. Worth and Baton Rouge non-attainment areas are located within about 300 kilometers of Class I areas. Houston-Galveston and Beaumont-Port Arthur are at least 500 km distant from any Class I area.

For the non-attainment areas in Texas, MOBILE6-compatible files were acquired from the TTI and the TCEQ. TTI provided hourly and annual VMT and average speed distributions for 2002 by road type and vehicle type. The TCEQ provided MOBILE6-compatible files for 1999, which were grown to 2002 based on additional information provided by the TCEQ. For Baton Rouge, the LDEQ supplied 2002 MOBILE6 input files, as well as 2002 VMT data from the Louisiana Department of Transportation Development (LDOTD).

2.2.2 Details of Data Acquisition for Urban Attainment Areas within 500 km of Class I Areas

Several urban attainment areas in the CENRAP domain are within 500 km of Class I areas (identified in Table 2-1). Of these, three provided locally developed activity data for mobile sources: (1) New Orleans, Louisiana; (2) St. Louis, Missouri; and (3) Lincoln, Nebraska. Other urban areas were unable to provide locally developed activity data within the time available for data acquisition; therefore, VMT data were acquired for these areas from state DOTs. Activity data for a few urban attainment areas have become available very recently or will become available soon (e.g., Kansas City, Missouri-Kansas; Minneapolis-St. Paul, Minnesota). These locally developed data are recommended for use during future inventory development projects.

2.2.3 Details of Data Acquisition for All Other Areas

Texas and Louisiana provided MOBILE6 inputs and activity data for all counties or parishes within those states. Mobile source activity data for 2002 were acquired from the state DOTs in Arkansas, Missouri, Iowa, Minnesota, Oklahoma, Nebraska, and Kansas. In all cases, the data acquired from the state DOTs contain the same type of information as the national HPMS database. However, in some cases, the data supplied by states were more up to date than the latest version of the national HPMS database.

2.3 DATA PREPARATION

A broad array of data types and formats were acquired for this task, which necessitated a strategic data processing scheme to assemble, process, and format the data for use with SMOKE/MOBILE6. The processing scheme was carried out for the following data types:

1. Data acquired for non-attainment areas (MOBILE-compatible inputs)
2. Data acquired for urban attainment areas (MOBILE-compatible inputs or transportation model data)
3. Data acquired for all other areas (HPMS)

Two standardized data processing algorithms were developed to process (1) MOBILE-compatible inputs and transportation demand model data or (2) national HPMS data. **Figure 2-2** illustrates the processing scheme applied to the MOBILE-compatible input data and transportation model data. **Figure 2-3** illustrates the processing scheme applied to the HPMS data. These algorithms included functions to process VMT data into the formats required by SMOKE and to process and calculate average speed distributions and temporal profiles. The outputs of the data processing schemes were SMOKE-ready input files suitable for use with MOBILE6 running within the SMOKE emissions processor.

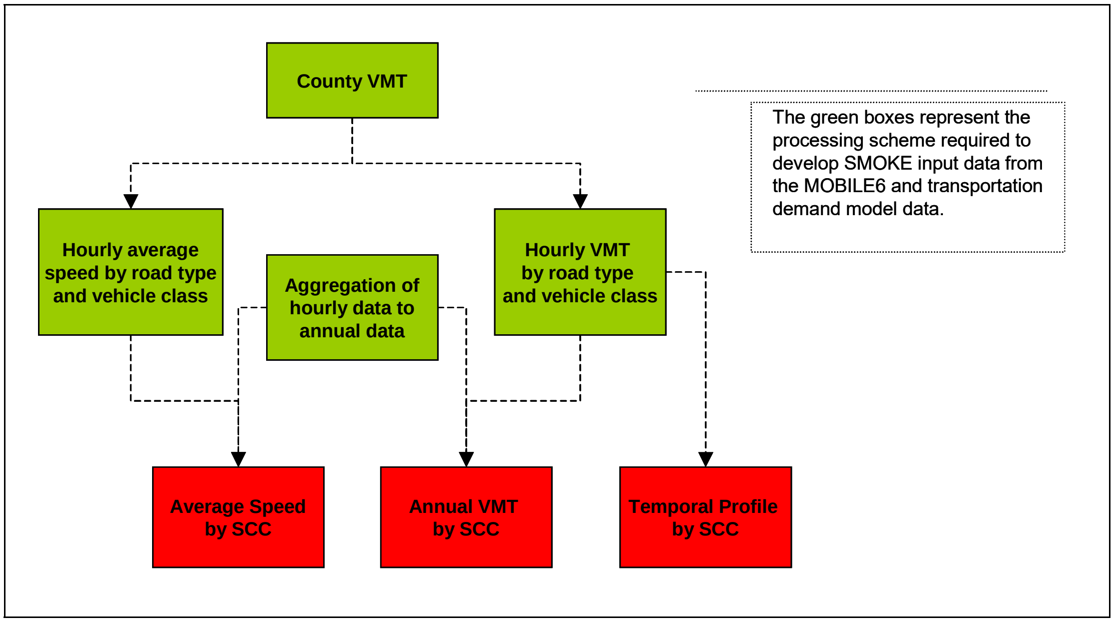

Figure 2-2. Illustration of the processing scheme applied to the MOBILE-compatible input data and transportation model data to develop SMOKE input files.

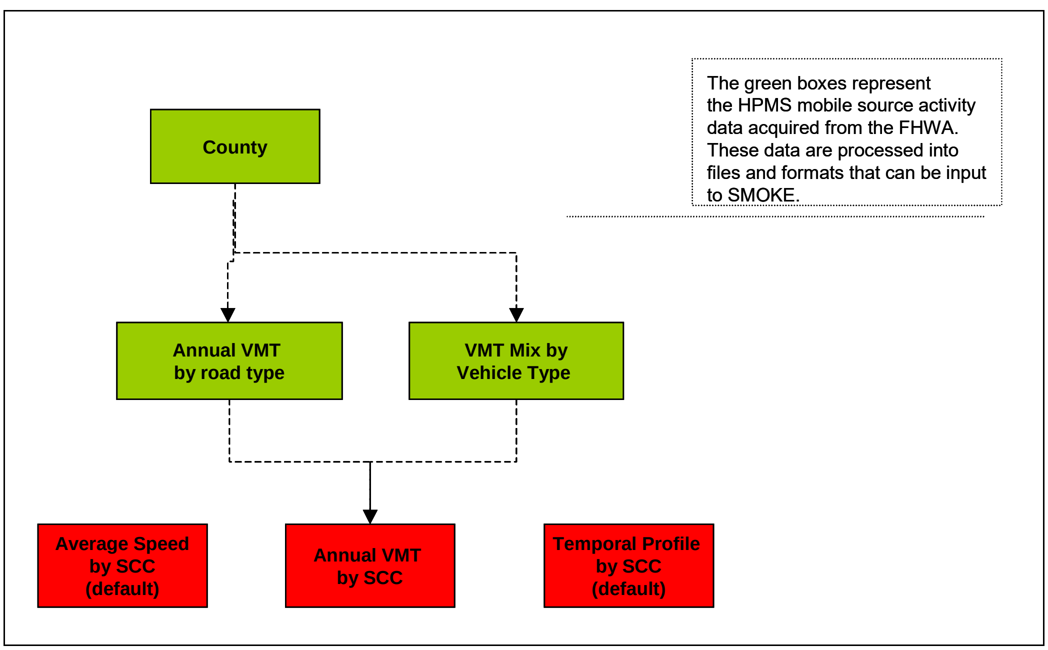

Figure 2-3. Illustration of the processing scheme applied to the national HPMS data.

2.3.1 Details of Data Preparation for Mobile Source Activity Data

SMOKE requires VMT data distributed by 96 standard source classification codes (SCC). Each SCC denotes a vehicle type and a road type combination of those listed in **Table 2-2**. For each state in the CENRAP domain, STI compiled SMOKE inputs for the 96 SCCs using the data sets discussed in Section 2-2.

Table 2-2. Definitions of the 8 vehicle types and 12 road types used by SMOKE.

Vehicle Types	Road Types
LDGV - Light Duty Gasoline Vehicles	Rural Interstate
LDGT1 - Light Duty Gasoline Trucks 1	Rural Principal Arterial
LDGT2 - Light Duty Gasoline Trucks 2	Rural Minor Arterial
HDGV - Heavy Duty Gasoline Vehicles	Rural Major Collector
LDDV - Light Duty Diesel Vehicles	Rural Minor Collector
LDDT - Light Duty Diesel Trucks	Rural Local
HDDV - Heavy Duty Diesel Vehicles	Urban Interstate
MC - Motorcycles	Urban Freeway

	Urban Collector
	Urban Local

2.3.2 Details of Data Preparation for Temporal Profiles

SMOKE uses a default library (data file) of monthly, weekly, and diurnal temporal profiles for all emissions source categories. STI reviewed and revised the default SMOKE/EPA profiles to better represent the temporal patterns of on-road mobile emissions in the CENRAP domain. For Texas and parts of Missouri, where locally developed temporal data were available, local temporal profiles were added to the SMOKE profile library. For other areas, representative temporal profiles were selected. Day-of-week temporal profiles were adopted from a recent study of traffic activity patterns (Coe et al., 2004). Monthly temporal profiles were based on the 1995 National Personal Transportation Survey (Federal Highway Administration, 1995). Diurnal profiles were based on the SMOKE/EPA default profiles for counties inside metropolitan statistical areas (MSAs) and other relatively urbanized counties. For other counties, where population densities or urban populations fell below established thresholds, diurnal profiles were based on Texas' profiles for groups of counties sharing similar population characteristics. (Population demographics were acquired from the U.S. Census Bureau.)

2.4 QUALITY ASSURANCE

On completion of the development of the VMT data, speed distribution data, and temporal profiles, the following quality assurance/quality control (QA/QC) reviews were

conducted, and graphical illustrations were included as an appendix to the Final Report. In addition, the procedures outlined in the project Quality Assurance Project Plan (QAPP) were followed (Sullivan, 2004).

- Examine county-level total VMT estimates and their relative magnitudes and distributions throughout the domain.
- Examine VMT fractions by road type and vehicle type.
- Examine maps, plots, and graphs of VMT by county, road type, and vehicle type.
- Examine graphs of speed distributions by road type and region.
- Examine graphs of temporal profiles for each region.

3. METHODS TO PREPARE FLEET CHARACTERISTICS FOR ON-ROAD MOBILE SOURCES

Emission factors for on-road mobile sources vary with the following fleet characteristics, which are derived from state transportation departments' vehicle registration records.

- *The vehicle age distribution* determines (1) the estimated proportion of the fleet that has been designed to meet certain emissions standards, and (2) the estimated average deterioration level of on-board emissions control devices. Vehicle design standard and deterioration level, in turn, are variables that govern the choice of emission factor.
- The *fractions of the vehicle fleet that are powered by different fuels* (e.g., gasoline or diesel) affect the choice of appropriate emission factors.

Registration distributions vary widely across regions, and Giannelli et al. (2002) indicated that registration distributions exert a major influence (i.e., potentially more than a 20% change) on MOBILE6-modeled emission factors. Therefore, the application of county-specific registration distributions is essential to the development of accurate emission inventories for on-road mobile sources. This section describes the information sources used and the data processing steps followed to prepare fleet characteristics, including vehicle age distributions and vehicle fuel fractions.

3.1 DATA ACQUISITION

Seven state DOTs in the CENRAP region provided extracts of their vehicle registration databases, which were decoded and processed to prepare MOBILE6-ready fleet-age distributions and fuel fractions for light-duty vehicles. The DOTs provided vehicle identification numbers (VIN) and county codes for every vehicle registered in their states on a specified date. The VIN records were decoded to yield vehicle ages and fuel types, which were used to calculate county-specific fleet characteristics. **Table 3-1** provides details about each of the acquired vehicle registration databases.

Texas provided ready-made MOBILE6 inputs, including fleet characteristics, for use in this project. Arkansas was excluded from development of fleet characteristics because the state is currently developing an on-road mobile source inventory, which is expected to be available in 2004. Instead, MOBILE6 default fleet characteristics were used for the state of Arkansas. Fleet characteristics were developed for light-duty vehicles only because heavy-duty vehicles are often used for interstate travel; therefore, national average fleet distributions (i.e., MOBILE6 defaults) are reasonably representative.

Table 3-1. Descriptions of acquired vehicle registration databases and related information.

State	Vehicle Registration Database Characteristics		Contact Information	Comments
	Number of Records	Date Represented		
Texas	n/a	n/a	Mary McGarry-Barber and Chris Kite, Texas Commission on Environmental Quality	Texas provided ready-made fleet characteristics.
Louisiana	2,941,066	July 1, 2002	Cecile Bush and Ray Thomas, Louisiana Department of Public Service	
Arkansas	n/a	n/a	Mary Pettyjohn, Arkansas Department of Environmental Quality and Charles Beaver, Arkansas Department of Revenue	Arkansas is currently funding a separate project to process VINs and estimate emissions from on-road mobile sources. Results will be made available to CENRAP in 2004.
Oklahoma	5,703,980	January 9, 2004	Ray Bishop, Oklahoma Department of Environmental Quality and Chuck Dusenbery, Oklahoma Tax Commission	Oklahoma's database included registrations of non-road vehicles, such as recreational boats, which were eliminated after the automated VIN decoding process.
Kansas	2,568,781	January 21, 2004	Donnita Thomas and Leonard Corkill, Kansas Department of Revenue	
Missouri	5,069,888	February 1, 2004	John Rustige and Fonda Thomas, Missouri Department of Natural Resources and	
Iowa	2,880,936	October 31, 2003	Chad Daniel and Priyanka Painuly, Iowa Department of Natural Resources	
Nebraska	1,850,509	December 11, 2003	David Brown, Nebraska Department of Environmental Quality and Deric Bloom, Nebraska Department of Motor Vehicles	Nebraska uses a state-specific system of county identification codes.
Minnesota	4,606,640	February 1, 2004	Innocent Eyoh and Chun-Yi Wu, Minnesota Pollution Control Agency and Judith Franklin, Minnesota Department of Public Safety	

3.2 DATA PREPARATION, QUALITY ASSURANCE, AND QUALITY CONTROL

The following steps were carried out to prepare, error-check, and correct the vehicle registration databases as needed before carrying out the process of VIN decoding.

- Load records into a unified database for processing.
- Translate county codes if necessary.
- Eliminate null VIN and county federal information processing standard (FIPS) codes.
- Identify and eliminate duplicate VINs.
- Independently verify the number of records.
- Export files for VIN decoding.

Load records into a unified database for processing. All vehicle registration records, including VINs and county FIPs codes, were unified into a structured query language (SQL) database. The unified SQL database supported more efficient preliminary data processing, quality assurance, and quality control procedures and permitted a running record of any changes made to the data sets. Copies of the original data sets from the states were archived before loading them into the unified database.

Translate county codes. Each state provided county information for registration records. Iowa's and Louisiana's databases included FIPS county codes. Kansas', Minnesota's, Missouri's, Nebraska's, and Oklahoma's databases contained county names or county codes that were translated to conform to the standard 5-digit FIPS format, "SSCCC", where SS are 2 integers that identify the state and CCC are 3 integers that identify the county or parish. VIN records without valid county names or codes were eliminated. For example, some of the VIN records were classified as state vehicles and were not assigned to any county. Less than one percent of the VIN records received from each state were eliminated due to unavailable county codes.

Eliminate null VIN and FIPS records. Null VIN and FIPS entries were identified, and records that contained null entries were eliminated. Less than one percent of the records from each state contained null entries. An additional 6% of the Kansas records were eliminated because they were flagged as representing trailers or mobile homes rather than on-road vehicles.

Identify and eliminate duplicate VINs. Each state's database was examined for duplicate VINs. Theoretically, no duplicates should exist because each VIN uniquely identifies a single vehicle. However, duplicate VINs may appear in a vehicle registration database for a variety of administrative reasons, such as failure to update vehicle information associated with changes of owner address or transfers of vehicle ownership. Each state DOT was contacted to discuss any duplicates in their registration databases. Duplicates that occurred within the same county were simply deleted, but cross-county duplicates were retained in most cases. The State of Missouri identified the most recent database entry associated with each duplicate VIN. Therefore, cross-county duplicates were eliminated from Missouri's database by retaining only the most recent duplicate record. The frequencies of duplicate records in the final databases were small for most of the states (i.e., less than one in ten thousand for the Kansas, Louisiana, Minnesota, Nebraska, and Oklahoma data sets). Thus, the potential errors in the vehicle age and fuel type distributions

are expected to be small or negligible. However, a significant number of duplicate records could not be eliminated from Iowa's databases and may represent a source of error in the fleet characteristics for that state. **Table 3-2** summarizes the numbers of duplicate records existing in the vehicle registration databases for each state.

Table 3-2. Summary of null and duplicate VIN record identification and elimination.

State	Original Database (as received)		Final Database	
	Total No. Records	% Duplicates	Total No. Records	% Duplicates
Texas	n/a	n/a	n/a	n/a
Louisiana	2,941,090	0.004	2,941,066	0.004
Arkansas	n/a	n/a	n/a	n/a
Oklahoma	5,704,139	0.000	5,703,980	0.000
Kansas	2,782,208	0.002	2,568,781	0.002
Missouri	5,230,782	2.960	5,069,888	3.053
Iowa	3,111,046	19.016	2,880,936	5.939
Nebraska	1,863,340	0.002	1,850,509	0.002
Minnesota	4,611,407	0.005	4,606,640	0.005

Verify the number of records. The final number of records in each state's database was compared to the number of registered vehicles reported by the FHWA (Federal Highway Administration, 2004) and the state's population as reported for the 2000 Census (U.S. Census Bureau, 2004). The population comparison was performed at a county level to ensure that the most populated counties in each state had the highest numbers of registered vehicles. When large discrepancies were observed, the appropriate state agencies were contacted to resolve the differences. For example, Oklahoma's vehicle registration database includes off-road vehicles. VINs for off-road vehicles were eliminated following VIN decoding, at which time the numbers of records compared better with the figures reported by the FHWA and the 2000 Census. Louisiana's vehicle registration database contained a relatively low number of vehicles (given the state's population and FHWA's reported number of registered vehicles); however, the Louisiana Department of Public Safety confirmed that the number of records in their database was correct.

Export files for VIN decoding. The final VIN data sets for each state were exported into separate ASCII text files and formatted for VIN decoding.

3.3 VIN DECODING

Eastern Research Group (ERG) developed and maintains VIN decoding software that returns model year, series, gross vehicle weight rating, fuel type, and other vehicle specifications

for all domestic and foreign light duty vehicles sold in the United States from 1972 to 2002.[1] Version 2000.01 of the ERG VIN Decoder was used to decode the VINs received from state registration databases. Before proceeding with VIN decoding, the accuracy of the VIN decoder software was validated by decoding several known VINs and verifying the results and by comparing results to the outputs of other VIN decoders.

After the VINs from each state were decoded, the age of each decoded vehicle was determined by subtracting the model year from the current year, where the current year was defined for each state as the year represented by its VIN data set (see Table 3-1). For each county and each vehicle type, the fractions of vehicles aged <1 through 24 years were calculated. Vehicles of ages greater than 24 years were assigned to age 24. The products of these calculations were county-specific fractional age distributions for light-duty vehicle classes.

In addition, the ERG VIN Decoder returned the type of fuel utilized by each decoded vehicle. The fractions of diesel-fueled vehicles in each county, vehicle class, and age group, from age <1 through 24 or greater were calculated. In some cases, vehicle populations were very small and required extrapolation or aggregation across geographic areas or vehicle classes to calculate representative diesel fractions. The results of these calculations are diesel fractions for each county, light-duty vehicle type, and age group. Too few natural-gas powered vehicles were identified to produce meaningful distributions; therefore, MOBILE6 defaults were used for this fuel type (unless locally developed MOBILE6 inputs were provided).

3.4 FINAL QUALITY ASSURANCE, QUALITY CONTROL, AND DATA PREPARATION

On completion of VIN decoding, the following QA/QC reviews and processing steps were conducted to prepare the MOBILE6-ready inputs, and graphical illustrations were included in an appendix to the Final Report. In addition, the procedures outlined in the project QAPP were followed (Sullivan, 2004):

- Verify the number of decoded VIN records.
- Examine the vehicle age fractions and fuel type fractions for reasonableness.
- Independently calculate and verify a vehicle age fraction and a fuel type fraction.
- Parse the vehicle age distributions and fuel type fractions into MOBILE6-ready inputs.
- Verify correct parsing and formatting of the final deliverables.
- Test the use of these files with the SMOKE emissions processor.

Verify the number of decoded VIN records. The ERG VIN Decoder appended several fields containing vehicle information and error codes to the original data records containing the VINs and FIPS codes. The number of records contained within each decoded file was verified to be equal to the number of records originally submitted for decoding. The decoded VIN files were loaded into the unified SQL database for the final QA/QC procedures. VINs that were not

[1] A listing of the vehicle manufacturers treated by the software and more information is available online at http://www.ergweb2.com/vindecoder/index.cfm.

decoded by the software remained in the output files and were flagged with error codes for explanation.

Examine the vehicle age fractions and fuel type fractions for reasonableness. Two separate files, one containing the age distributions for all vehicle classes and counties and another containing the diesel fractions for all vehicle classes and counties, were loaded into the SQL database in order to examine the calculated fractions. The 25 vehicle fractions for each vehicle class and each county were verified to sum to one. The minimum, maximum, mean, and median fractions for each age class from all the age distributions were examined in order to identify any outlier values and assess their effects. Similarly, the minimum, maximum, mean, and median diesel fractions for each age class from all the vehicle classes and counties were examined. Pivot tables and corresponding pivot charts were also created for the default and calculated age distributions and diesel fractions in order to facilitate quick visual examinations.

Parse the vehicle age distributions and fuel type fractions into MOBILE6-ready inputs. The calculated age distributions for each vehicle class and county were contained within a single table in the SQL database that had variable character fields of character length 50 for the FIPS codes and the vehicle classes and 25 numeric fields of precision 0.0001 for the calculated age fractions. The calculated diesel fractions for each vehicle class and county were contained in a similar table in the SQL database. A separate ASCII text file containing 25 age fractions for each of the 5 decoded vehicle classes was exported from the SQL database. The space-delimited text files contained the header REG DIST on the first line followed by rows of 26 fields containing the vehicle class code and the age fractions from zero to age 24. The diesel fractions were exported into similar ASCII text files for each county. The files contained sets of 25 diesel fractions for 14 of the 16 combined MOBILE6 vehicle classes, for a total of 350 fractions. For the remaining 2 vehicle classes, MOBILE6 assumes that all motorcycles (MC) are gasoline-fueled and all urban/transit buses (HDBT) are diesel-fueled. The age distribution files were prepared as external inputs for the MOBILE6 runs, while the diesel fractions were incorporated into the MOBILE6 input files.

Verify correct parsing and formatting of the final deliverables. A random sample of registration distribution files and diesel fraction files were examined to ensure that the files were properly exported from the SQL database. The selected registration distribution files were verified to contain the appropriate heading and 25 age fractions for each of the 5 vehicle classes. The selected diesel fraction files were verified to contain 5 sets of 25 fractions with 10 fractions in the first row of each set, 10 fractions in the second row of each set, and 5 fractions in the third row of each set.

Test the use of these files with the SMOKE emissions processor. The selected registration distribution files were run through the SMOKE emissions processor using a test MOBILE6 input file with default values to ensure that the files ran properly within the framework of MOBILE6 operating within SMOKE. Similarly, the selected diesel fractions were verified with a test MOBILE6 input file. The diesel fractions were incorporated into the test input file, each in turn, and the files were run through SMOKE to ensure that the diesel fractions were formatted properly to run within the framework of SMOKE.

4. METHODS TO PREPARE FUELS CHARACTERISTICS AND IMPACTS OF REGULATORY CONTROLS FOR ON-ROAD AND OFF-ROAD MOBILE SOURCES

Fuel parameters and regulatory controls can significantly impact emission factors predicted by the MOBILE6 model (for on-road sources) and the NONROAD model (for off-road sources). This section describes the information sources used and the data processing steps followed to prepare fuels characteristics and regulatory control settings for use in MOBILE6. When appropriate, fuels characteristics were also prepared for the NONROAD model.

4.1 FUELS CHARACTERISTICS

Three characteristics of fuels significantly affect criteria pollutant emission predictions from the MOBILE6 and NONROAD models:

1. Sulfur content
2. Fuel volatility
3. Oxygenate content

Fuel sulfur content directly affects emissions of sulfates (particulate matter) and SO_2 from combustion of all fuels. In addition, sulfur's adverse effects on catalytic converters indirectly affect emissions of VOCs, CO, and NO_x from gasoline-fueled vehicles. Fuel volatility and oxygenate content are only necessary for gasoline-fueled vehicles.

EPA found that gasoline volatility can have a major effect on MOBILE6 estimates of VOC and CO emissions (Giannelli et al., 2002), although the influence diminishes at lower temperatures and has no effect at temperatures below 45^{o}F (Tang et al., 2003). Oxygenates for gasoline fall into two classes: alcohols and ethers (see **Table 4-1)**. All are assumed to reduce emissions of CO, but ethanol can also increase the gasoline volatility.

Table 4-1. Common types of oxygenates (listed in approximate order of decreasing prevalence).

Alcohols	Ethers
Ethanol	Methyl tert-butyl ether (MTBE)
Methanol	Tert-amyl methyl ether (TAME)
Butanol	Ethyl tert-butyl ether (ETBE)
	Diisopropyl ether (DIPE)

Both MOBILE6 and NONROAD accept sulfur content information on a weight basis. MOBILE6 requires that sulfur content be specified in parts per million by weight (ppmw or sometimes just ppm), and NONROAD requires that sulfur content be expressed as a percentage by weight (wt. %). Gasoline volatility is expressed in terms of Reid Vapor Pressure (RVP), or pounds per square inch (psi). The extent to which oxygenates are present can be defined either

as the percentage of a specific oxygenate blended by volume (% vol.), or the total weight percentage (% wt.) of oxygen atoms in the blended fuel.

4.1.1 Data Acquisition

For gasoline and diesel fuel, a number of information sources exist, including EPA, commercial data sources, state departments of agriculture, and fuel associations. In addition, the American Society for Testing and Materials (ASTM) standards can be used as guidelines for areas where information is missing or incomplete. Each of these sources of information is discussed in greater detail below.

For compressed natural gas (CNG) and liquefied petroleum gas (LPG), only the NONROAD model requires fuels characteristics, and the only information required is the sulfur content. NONROAD only allows entry of a single sulfur content to describe both fuels, although CNG and LPG sulfur contents sometimes differ. However, for both fuels, the sulfur content is very low (often well below specifications), is rarely tested, and currently has a negligible impact on the overall inventory (although it may become more important in the future as sulfur levels in gasoline and diesel fuel drop). Therefore, for NONROAD, a CNG/LPG sulfur content of approximately 0.0007 wt. % was used, which is consistent with the CNG sulfur content assumed by EPA's AP-42 publication for stationary sources (U.S. Environmental Protection Agency, 1998a).[2]

U.S. Environmental Protection Agency

EPA maintains a database of reformulated gasoline (RFG) data for those areas that utilize RFG. Also, MOBILE6 allows RFG to be modeled explicitly (i.e., the model chooses appropriate values for sulfur content, volatility, and oxygen content). For future inventories, information for fuels sold in other areas may be available from EPA. Specifically, federal regulations (40 CFR 80.370 and 40 CFR 80.593) will require refiners to submit annual reports of sulfur content to EPA by February 2005 and February 2007 for gasoline and diesel fuel, respectively.

Commercially available data

Information about gasoline and diesel fuel compositions is available for purchase from Northrop Grumman and the American Association of Automobile Manufacturers (AAM). These data are the basis for fuel data estimated in EPA's National Emission Inventory (NEI) (E.H. Pechan and Associates, 2004). However, each of these data sets consists of a relatively small number of samples from relatively few areas (e.g., 1-6 cities per state, 1-20 samples per city, and 1-3 locations per city). Data are collected by these entities for winter and summer months only.

AAM can identify specific laboratories and analytical methodologies used, whereas Northrup Grumman's data are reported by a number of private companies and laboratory information cannot be readily tracked down. However, the AAM data are less extensive than the

[2] A sulfur content of 0.0007% (wt.) corresponds to 2000 gr/MMscf = 0.2 gr/100 scf. This factor includes sulfur that is added for safety purposes (odorant).

Northrop Grumman data, and costs are significantly higher. Therefore, Northrup Grumman's data were used rather than AAM's data.

State departments of agriculture

Some weights and measures divisions of state departments of agriculture test gasoline and/or diesel fuel on a regular basis and are able to provide these data electronically. These data are often far more extensive (e.g., hundreds or thousands of samples taken, throughout the entire year and the entire state) than the data available from commercial surveys. Thus, they represent a significant improvement over the commercially available data when available.

For 2002, data were available from three of the CENRAP states (Kansas, Minnesota, and Missouri), and it is likely that Texas will have data for future calendar years. Oklahoma conducts tests but currently does not maintain a database of results.[3] Other CENRAP states do not currently test for fuel parameters relevant to mobile source emissions modeling.

Oxygenated fuel and octane grade data

In several CENRAP states, blending ethanol into fuel is prevalent, even though no regulatory requirements are in effect. The U.S. Department of Energy's Energy Information Administration (EIA) tracks sales volumes of gasoline and oxygenated gasoline by state; however, these data are tracked at the refinery, whereas blending of ethanol is more likely to occur downstream of the refineries at bulk terminals (due to difficulties associated with sending ethanol-blended fuel through pipelines). For states known to blend significant amounts of ethanol, oxygenated fuel associations were contacted to determine the extent of blending.

EIA data were also collected for the purposes of obtaining information about relative sales of regular and premium gasoline. This information was used to estimate the weighted average sulfur content because sulfur contents are significantly higher for regular gasoline than premium gasoline.

Standards and existing assumptions

ASTM standards provide volatility guidelines for every part of the country and every month. ASTM standards, regulations, and assumptions made by state and local agencies/MPOs were collected for the purposes of filling in gaps in fuel sampling data, quality assurance, and consistency with current inventories. However, it should be noted that average values are often below regulatory limits to allow a margin of compliance. In addition, ASTM standards are not regulatory limits, and EPA has found that RVP values can often exceed the ASTM standards (U.S. Environmental Protection Agency, 1992, pp. 25-26).

[3] Oklahoma's Department of Agriculture deferred to the Oklahoma Corporation Commission, which is the lead agency for fuel testing in that state.

4.1.2 Data Processing and Quality Assurance

In general, fuels characteristics were defined for various geographic subregions of the CENRAP region, various fuel types, and for on-road or non-road sources. Fuels characteristics were then organized and prepared for use with MOBILE6 and NONROAD. The discussions below provide the relevant factors that were considered when calculating or preparing the fuels characteristics for diesel fuel and gasoline.

Diesel fuel

As stated previously, sulfur content is the only parameter of interest for diesel fuel. In 2002, transportation-grade diesel fuel was required to have a sulfur content of no more than 500 ppmw = 0.05 wt. %, and for the 2002 NEI, EPA assumed that sulfur content was approximately 500 ppm for all areas of the United States from 1994 through 2002 (E.H. Pechan and Associates, 2004). However, average sulfur content is likely to be lower than the regulatory standard. Furthermore, EPA regulations require sulfur content to be less than 15 ppmw = 0.0015 wt. % by September 1, 2006. Thus, refineries are likely to be lowering the sulfur content of their diesel fuel already. Therefore, available diesel fuel sulfur content information for 2002 was inspected for statistically significant seasonal or regional differences, and for differences between on-road and off-road fuels.

Reformulated Gasoline (RFG)

For areas utilizing RFG (covered areas), little data processing was required because RFG can be modeled explicitly by MOBILE6 with command “FUEL PROGRAM : 2”. The only areas of the CENRAP currently utilizing RFG are listed in **Table 4-2**. When RFG is modeled explicitly, user inputs for sulfur content and RVP are overridden by the program. User-supplied oxygenate levels are also overridden, with the exception of user-specified wintertime oxygen contents greater than 2.1 wt. % (U.S. Environmental Protection Agency, 2003a, 2002d). Therefore, in each covered area, the extents to which wintertime oxygen contents are above this level were examined.

Table 4-2. Listing of CENRAP areas utilizing RFG.

Metropolitan Area	Specific Counties
St. Louis, Missouri	Franklin, Jefferson, St. Charles, St. Louis
Dallas/Fort Worth, Texas	Collin, Dallas, Denton, Tarrant
Houston/Galveston, Texas	Brazoria, Fort Bend, Galveston, Harris, Liberty, Montgomery, Waller, Chambers

Source: 40 CFR 80.70.

When the “FUEL PROGRAM : 2” command is used, the user must also specify whether the RFG is being used in a southern or northern area. These are referred to as “VOC-Control Region 1” and “VOC-Control Region 2”, respectively, by federal regulations (40 CFR 80.71); both Missouri and Texas are in VOC-Control Region 1, which corresponds to a MOBILE6 input of “S” (for southern).

Areas not using RFG – spatial variability and local requirements

Historically, regional differences in gasoline were modeled by dividing the country into districts on the bases of pipelines and other distribution channels. Northrop Grumman still organizes its gasoline data by these districts. Although the continued appropriateness of these divisions has not been verified (and does not account for RFG usage, localized regulations in metropolitan areas, and regional ethanol blending), the district divisions were utilized to investigate spatial differences among areas that do not have localized requirements. The five districts for various metropolitan areas within CENRAP are identified in **Table 4-3**.

Table 4-3. Gasoline distribution districts identified by Northrop Grumman.

District	CENRAP Metropolitan Areas
3 (Southeast)	Little Rock, Arkansas New Orleans, Louisiana
5 (North Central)	Minneapolis-St. Paul, Minnesota
7 (Central and Upper Plains)	Kansas City (Kansas/Missouri) Davenport, Iowa Des Moines, Iowa St. Louis, Missouri Omaha, Nebraska
8 (Oklahoma and East Texas)	Tulsa, Oklahoma Dallas-Ft. Worth, Texas Houston, Texas San Antonio, Texas
11 (New Mexico and West Texas)	Amarillo, Texas El Paso, Texas

Localized regulations restrict summertime fuel volatility, and include requirements and restrictions for oxygenate usage; but currently, there are no localized controls on gasoline sulfur content in the CENRAP region.

Sulfur content of gasoline (non-RFG)

MOBILE6 incorporates two elements of gasoline sulfur content data: (1) information about the average sulfur content existing during the calendar year of interest (for purposes of determining SO_2 and PM emissions), and (2) information about the maximum sulfur content ever experienced by vehicles in a given model year (for purposes of determining deterioration of catalysts). Available fuel data can only be utilized to modify sulfur contents for the calendar year of interest, not the lifetime maxima of fuel contents ever experienced. Data for regular and premium gasolines were averaged separately, and weighted average sulfur contents were determined based upon relative sales volumes of different grades of gasoline. Given the limited availability of data, the calculated weighted average sulfur contents were only added to MOBILE6 input files if they differed significantly from the MOBILE6 default values.

Default sulfur content data can be different for "western" areas due to a geographic phase-in of gasoline sulfur regulations. However, this only affects Nebraska (of the CENRAP states) and calendar year 2003 and later. A full listing of MOBILE6 default sulfur contents is shown in **Table 4-4**.

Table 4-4. MOBILE6 default sulfur content data for conventional gasoline (i.e., non-RFG).

Calendar Year	Average Fuel Sulfur Content (ppmw)		Vehicle Model Year	Maximum Fuel Sulfur Content Experienced (ppmw)	
	Eastern Areas[a]	Western Areas[b]		Eastern Areas[a]	Western Areas[b]
2000	300	300	2000[c]	1000	1000
2001	299	299	2001	1000	1000
2002	279	279	2002	1000	1000
2003	259	263	2003	1000	1000
2004	121	160	2004	303	325
2005	92	160	2005	303	325
2006	33	160	2006	87	325
2007	33	60	2007	87	142
2008+	30	30	2008+	80	80

[a] Within CENRAP, this includes all counties except those specifically identified as western areas.
[b] Within CENRAP, this only includes the following counties, all of which are located in western Nebraska: Banner, Box Butte, Cheyenne, Dawes, Deuel, Garden, Keith, Kimball, Morrill, Scotts Bluff, Sheridan, and Sioux (Source: 40 CFR 80.215(a)(2)(i)).
[c] Within MOBILE6, maximum sulfur content does not affect emissions from vehicles of model year 1999 and older.

RVP and oxygenate content of gasoline (non-RFG) – agriculture department data

For RVP and oxygenate, the data obtained from state departments of agriculture were analyzed. For regions where data were available, temporal variations in volatilities over the course of the year were compared with the variations in the corresponding ASTM standards for those regions. Within each state, areas known to have local regulatory requirements were examined separately from areas without such requirements, and gasoline blended with ethanol was examined separately from other gasoline. (Methodology documentation for the 2002 NEI indicates that, aside from areas with local requirements, RVP was assumed to be uniform across each state [E.H. Pechan and Associates, 2004].) The limited data obtained from Northrop Grumman were compared to the agriculture departments' data for purposes of gauging the extent to which the Northrop Grumman data are representative.

EPA and local regulations restrict the maximum RVP of some summertime gasolines. For purposes of quality assurance, summertime RVP data were compared to these requirements. However, it should be noted that EPA and many local governments grant a waiver of 1.0 psi to ethanol blends (i.e., the blends are allowed to have RVP values that are 1.0 psi higher than regulatory limits[4]), and in such cases MOBILE6 assumes that the RVP of the ethanol-blended gasoline is 1.0 psi higher than the RVP specified in the model input file. Available data from

[4] EPA's waiver (40 CFR 80.27(d)) only applies if a sufficient quantity of ethanol is used (9-10% vol.)

state agricultural departments were utilized to investigate the extent to which the RVP of ethanol blends is higher than the RVP of conventional gasoline. If differences were found to be considerably smaller than 1.0 psi, the area was modeled as one without a waiver (even if a waiver exists) to prevent MOBILE6 from increasing the RVP of the ethanol blends.

The extent to which a fuel is characterized as an "ethanol blend" depends on how this term is defined. In some cases, the blend is mandated. For example, the State of Minnesota requires that ethanol be blended into all gasoline sold in the state, year-round, to reach a level of 2.7-3.5 wt. % oxygen in the blend.[5] However, in other areas, a variety of levels of oxygenate are in use, and oxygenate analyses show a variety of oxygenate concentrations, which in some cases contain both alcohols and ethers in the same sample. Because MOBILE6 only models one oxygenate type or the other and assumes a single average oxygenate concentration, frequency plots were generated to determine the extent to which different oxygenate concentrations were present, and analytical data were screened to eliminate low data (e.g., near detection limits). It is worth noting that volatility increases due to ethanol tend to be somewhat independent of concentration above approximately 3%. This is important in areas modeled with RVP waivers, for which MOBILE6 will increase RVP by 1.0 psi for all ethanol blends, regardless of the ethanol concentration.

RVP and oxygenate content of gasoline (non-RFG) – other data

For states in which agriculture department data were not available, RVP estimates were based primarily on data obtained from Northrop Grumman in the summer and winter. These data were interpolated to different months using ASTM standards—similar to the procedure applied for the 2002 NEI (E.H. Pechan and Associates, 2004). Spatial and temporal variations were also compared to publicly available RVP data from the 1999 NEI (which was generated based upon data from Northrop Grumman and AAM). Areas with specific RVP or oxygenate restrictions were modeled to reflect those restrictions, even if no sampling data were available for those areas.

Although gasoline volatilities are highest in the winter, the extent of wintertime data analysis was tempered by two factors: (1) the effects of volatility are lessened at colder temperatures, and (2) MOBILE6 models any RVP higher than 11.7 psi as equal to 11.7 psi (U.S. Environmental Protection Agency, 2003a, 2002d).

General quality assurance

Given the recent court cases involving environmental laboratory fraud (Bureau of National Affairs, 2002a, b), particularly with respect to testing vehicle fuels (McCarthy, 2001; Bureau of National Affairs, 2002c; U.S. Department of Justice, 2002), an effort was made to determine the source of the data collected. Data from fuel testing sources known to have been indicted and/or convicted of laboratory fraud were discarded when appropriate. The methodologies utilized were also examined. For example, it is known that RVP measurements using Grabner equipment are adjusted using a variety of formulas (sometimes season-

[5] The 2.7% minimum oxygen content is identified by Section 239.791 of the Minnesota Statutes, and ethers are specifically excluded from meeting that requirement; Section 239.761 bans the use of ethers (above approximately 0.33%) and limits the maximum ethanol content to 10% vol., which corresponds to approximately 3.5 wt. % oxygen.

dependent), and gas chromatography (GC) results for oxygenates can differ from Fourier-transform infrared (FTIR) results. In addition, the procedures outlined in the project QAPP were followed (Sullivan, 2004).

4.1.3 Data Preparation

Fuels characteristics were prepared as a summary data table listing gasoline volatilities as a function of county and month, and the extent to which oxygenated fuel information and fuel sulfur contents differ from MOBILE6 defaults. The tables, which are included in an appendix to the Final Report, show the appropriate MOBILE6 inputs with respect to the commands shown in **Table 4-5**. These command lines were inserted into the SMOKE input files for the complete set of geographic areas within the CENRAP and time periods within calendar year 2002.

Table 4-5. MOBILE6 input commands relevant to fuel composition.

Command	Meaning	Data
FUEL PROGRAM[a]	Identifies gasoline sulfur content, and whether RFG is being used	1 = eastern default sulfur values, 2 = RFG, 3 = western default sulfur values, 4 = user-supplied sulfur data
DIESEL SULFUR	Diesel sulfur content	Average diesel sulfur content, in ppmw
OXYGENATED FUELS[b]	Extent of oxygenate usage	% of gasoline sold that is blended with alcohols, and that is blended with ethers; average oxygen wt. % in each of those blends
FUEL RVP	Gasoline RVP (prior to ethanol addition, if any)	Average RVP, in psi
SEASON	For RFG, an identifier of which season's requirements are in effect	1 = summertime RFG, 2 = wintertime RFG

[a]Optional command; MOBILE6 default is FUEL PROGRAM = 1.
[b]Optional command; MOBILE6 default is no oxygenate.

4.2 REGULATORY CONTROLS

Regulatory controls that affect engine emissions and are modeled by MOBILE6 and/or NONROAD include the following:

- Anti-Tampering Programs (ATPs)
- Inspection & Maintenance (I/M) Programs
- Stage II Refueling Controls

Stage II refueling emissions are typically excluded from mobile source emission inventories developed using MOBILE6 because they are considered to be stationary area source

emissions. Thus, refueling emissions were excluded from the CENRAP emission inventory of on-road mobile sources, and associated MOBILE6 settings were not prepared. However, the appropriate MOBILE6 commands were prepared as a table and included in an appendix to the Final Report.

4.2.1 Data Acquisition

Environmental regulatory agencies in each of the CENRAP states were contacted for information regarding ATPs, I/M programs, and Stage II controls. These agencies provided the relevant information in the form of MOBILE6 input files.

4.2.2 Data Processing and Quality Assurance

Data processing consisted primarily of quality assurance, based in part on EPA technical guidance. Information provided by regulatory agencies was reviewed for consistency with EPA guidance and for reasonableness, and was investigated further if warranted. For example, I/M program compliance rates are often assumed to be 96% prior to implementation (U.S. Environmental Protection Agency, 2002d) but should be based on operating program data after they have been implemented. In addition, if a customized I/M program effectiveness is identified (using the I/M EFFECTIVENESS command), EPA requires that the state or local agency consult with the EPA first (U.S. Environmental Protection Agency, 2002d). For Stage II vapor recovery systems, a working system is assumed to be 95% effective. However, a 95% in-use effectiveness should not be input into MOBILE6 because this does not reflect rule penetration or rule effectiveness (U.S. Environmental Protection Agency, 1991b). Appropriate values for program compliance rates and in-use effectivenesses were selected and reported in a summary data table included in an appendix to the Final Report. In addition, the procedures outlined in the project QAPP were followed (Sullivan, 2004).

4.2.3 Data Preparation

Regulatory controls were prepared as a summary data table listing the counties that have ATPs, I/M programs, and/or Stage II vapor recovery, and as an electronic file with the associated MOBILE6 command lines. The tables, which are included in an appendix to the Final Report, show the appropriate MOBILE6 inputs with respect to the commands shown in **Table 4-6**. Command lines were inserted into the SMOKE input files for the geographic areas within the entire CENRAP region. (Note that the I/M commands are provided in external files that will be referenced by MOBILE6 through the "I/M DESC FILE" command.)

Table 4-6. MOBILE6 input commands relevant to non-fuel-related regulatory programs. (Command lines are needed only if programs are in place; some input files may require information for multiple ATPs and I/M programs.)

Command	Data
ANTI-TAMP PROG	Calendar years applied, vehicle model years affected, vehicle types affected, inspection frequency, compliance rate, types of components inspected
I/M PROGRAM I/M MODEL YEARS I/M VEHICLES I/M STRINGENCY[a] I/M COMPLIANCE[b] I/M WAIVER RATES[b] I/M CUTPOINTS[c] I/M EXEMPTION AGE[d] I/M GRACE PERIOD[d] NO I/M TTC CREDITS[e] I/M EFFECTIVENESS[f]	Calendar years applied, test frequency, program type, inspection test type, model years affected, vehicle types affected, failure rate, percentage of vehicles that get inspected and either comply or are waived, extent to which inspected vehicles are waived rather than being modified to comply, exempted vehicle ages, number of years that new vehicles are exempted, extent of technician training, customized program effectiveness values (pollutant-specific)
STAGE II REFUELING	Calendar year that Stage II program begins to be phased in, number of years of phase-in, in-use efficiency for light-duty vehicles, in-use efficiency for heavy-duty vehicles

[a] This command is only used for (and required for) exhaust I/M programs.
[b] This command is required for exhaust I/M programs and highly recommended for evaporative I/M programs.
[c] This command is only used (and is required) if I/M PROGRAM is IM240.
[d] This command is optional for exhaust I/M programs and highly recommended for evaporative I/M programs.
[e] This command is optional for exhaust I/M programs and is not used for evaporative I/M programs.
[f] This command is optional.

5. ADDITIONAL PARAMETERS FOR ON-ROAD MOBILE SOURCES

Additional optional inputs to MOBILE6 were prepared when readily available. These parameters are of lesser significance than VMT, fleet characteristics, fuels characteristics, or regulatory controls. However, they do have some effects and should be prepared when resources permit. In addition, consistency between the states' and the CENRAP's MOBILE6 inputs is desirable.

Examples included customized annual mileage accumulation rates, relative humidities, and/or natural gas vehicle (NGV) fractions that were provided by environmental regulatory agencies within the CENRAP region in response to other data requests. These data generally were provided in the form of MOBILE5 or MOBILE6 input files. Other inputs were relatively easy to determine. Altitude, which has been identified as having an "intermediate" (5-20%) effect upon VOC and NO_x emissions by EPA (Giannelli et al., 2002, p. iii), is easily determined from regulatory guidance and readily available geographic information systems (GIS) tools.

5.1 DATA ACQUISITION

MOBILE input files were requested from environmental regulatory agencies and/or MPOs in each of the CENRAP states, and optional input commands were reviewed and used if appropriate. Topographical GIS databases were used to determine altitudes.

5.2 DATA PROCESSING AND QUALITY ASSURANCE

Relatively little data processing was necessary, because data were in MOBILE5 or MOBILE6 format. However, consistency with applicable EPA guidance was checked.

In the case of altitude, MOBILE6 only allows the selection of "high" or "low" altitude. ("Low" is the default setting.) High altitude model outputs are based on conditions representative of approximately 5,500 feet above mean sea level (msl), and low altitude model outputs are based on conditions representative of approximately 500 feet msl (U.S. Environmental Protection Agency, 2003a, 2002d). EPA refers users to 40 CFR 86.091-30(a)(5)(ii) and (iv) for guidance. However, Section (a)(5)(ii) lists no CENRAP areas as "designated high-altitude locations" and Section (a)(5)(iv) names four counties in Nebraska (Banner, Cheyenne, Kimball, and Sioux) as specifically not "designated low-altitude locations." STI utilized GIS tools to determine that substantial portions of these counties are above 4,000 feet msl (see **Figure 5-1**) and that, therefore, they should be modeled as "high" altitude.

5.3 DATA PREPARATION

A summary data table listing the additional MOBILE6 input commands was included with an appendix to the Final Report. Command lines were inserted into the MOBILE6/SMOKE input files.

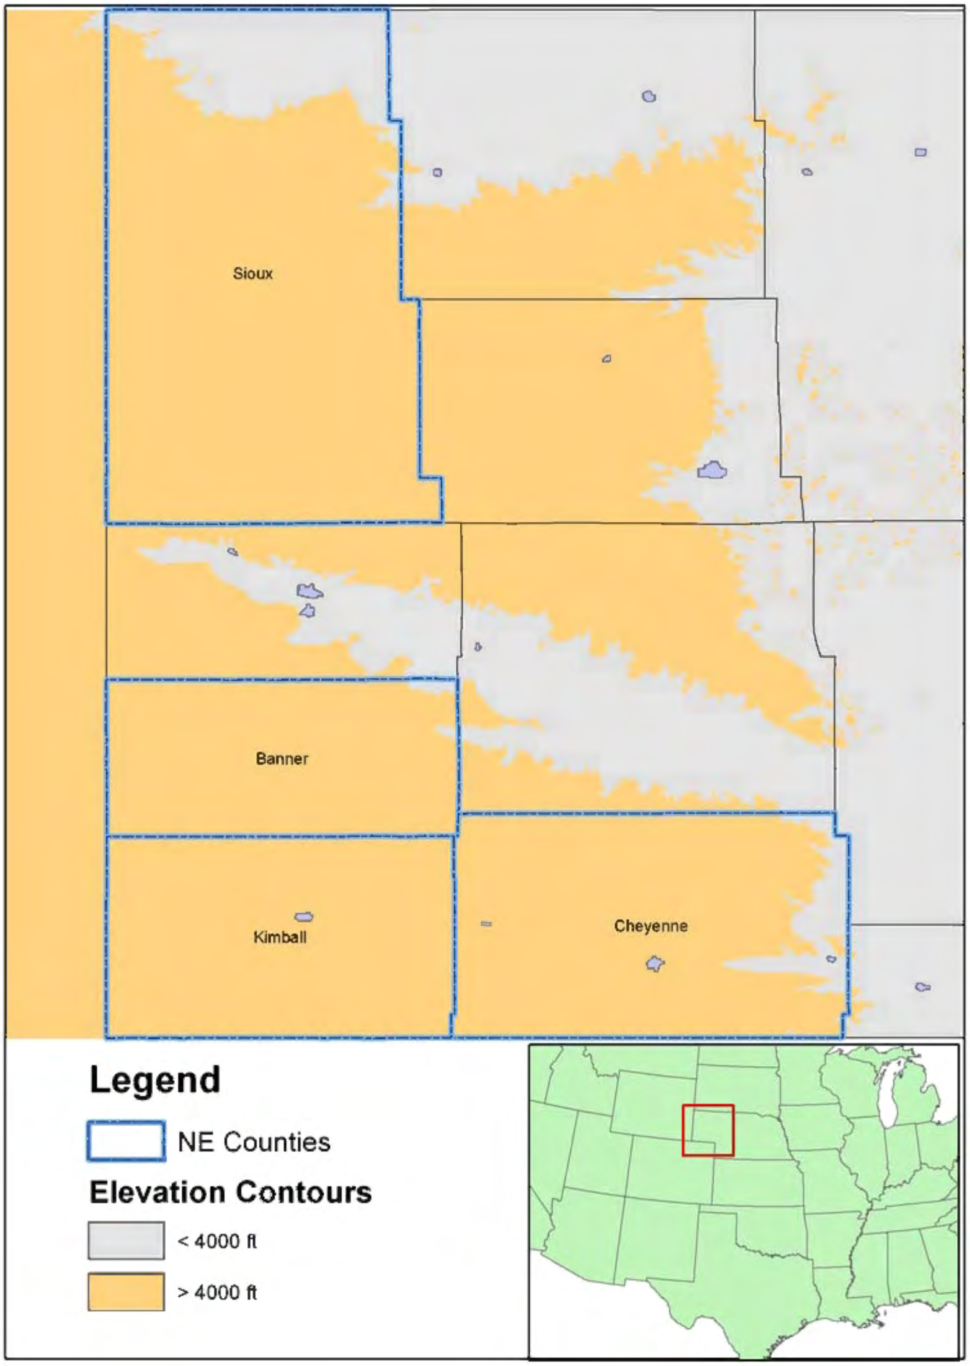

Figure 5-1. Extent to which western Nebraska counties are “high altitude” (above 4000 ft msl).

6. METHODS TO ESTIMATE EMISSIONS FOR NON-ROAD MOBILE SOURCES

Non-road mobile sources include equipment and vehicles that have internal combustion engines and are used off-road. Examples include ships, locomotives, aircraft, industrial equipment, recreational boats, and many others. This section describes information sources and methods used to prioritize efforts, gather activity data, and estimate emissions for non-road mobile sources.

6.1 PRIORITIZATION

STI reviewed the EPA's 1999 NEI (U.S. Environmental Protection Agency, 1999c) to assess the likely importance of various non-road sources to visibility in Class I areas. **Table 6-1** shows the top five non-road emitters of primary particulates and particulate precursors for counties in the CENRAP region containing or adjoining a Class I area. This review illustrated the likelihood that commercial marine vessels and railroad equipment impact visibility in the CENRAP's Class I areas more than most other non-road mobile sources. However, it also indicated that pleasure craft (recreational boats) are a much more significant source of particulates and particulate precursors than other types of recreational vehicles. It also demonstrated the importance of agricultural equipment, especially in Oklahoma and Missouri. Based on this analysis, an assessment of available resources, and consultation with the CENRAP's Emission Inventory Work Group, a decision was made to give bottom-up treatment to commercial marine vessels, locomotives, and recreational boats. These categories represent at least two-thirds of the non-road primary and precursor emissions in counties containing or adjacent to Class I areas in the CENRAP region.

Table 6-1. 1999 non-road emissions (tons/year) by state and source category for counties in the CENRAP region containing or adjoining a Class I area (U.S. Environmental Protection Agency, 2004b).

6.2 RECREATIONAL BOATS

6.2.1 Emissions Modeling with NONROAD

Emissions from recreational boats were modeled with the latest version of the EPA's NONROAD model. NONROAD categorizes equipment types by SCC code, and the codes pertaining to recreational boats are listed in **Table 6-2**.

Table 6-2. NONROAD source categories related to recreational boats.

SCC code[a]	Equipment Description
22-82-yyy-005	Pleasure Craft: Inboard Engine
22-82-yyy-010	Pleasure Craft: Outboard Engine
22-82-yyy-015	Pleasure Craft: Personal Watercraft
22-82-yyy-025	Pleasure Craft: Sailboat Auxiliary Engine

[a] In each code, the letters "yyy" refer to fuel type: 2-stroke gasoline (005), 4-stroke gasoline (010), or diesel (020).

For each of these source categories, the NONROAD model provides exhaust emission factors in units of grams of emissions per horsepower-hour (g/hp-hr) that are a function of engine types and sizes. Activity data include size-dependent engine populations, the load on the engines (hp) while they are in use, and the number of hours that the engines are in use per year. (These data are in turn utilized to calculate fuel consumption, which is needed for the calculation of

evaporative emissions.) Sources of these model inputs are primarily activity data collected by Power Systems Research, Inc. (PSR) and methodological information from a previous EPA non-road engine and vehicle study (U.S. Environmental Protection Agency, 1991a).

NONROAD includes the following default databases of recreational boating activity. Each may be updated with bottom-up or region-specific activity data, if available.

- NONROAD's default engine populations are based on 1998 PSR national surveys of engine manufacturer sales. The national population estimate was disaggregated to the state level by using a fuel consumption distribution developed by the Oak Ridge National Laboratory (ORNL). State-level populations were further disaggregated to the county level by using the total water surface area contained in each county (U.S. Environmental Protection Agency, 2002a).
- Default temporal profiles are based on two sources of information. Monthly allocation factors are derived from a boat usage survey done for the National Marine Manufacturers Association (NMMA) (U.S. Environmental Protection Agency, 2002c). Weekday-weekend allocation factors were derived from a survey of recreational marine use conducted in California during 1993 and 1994. These weekday-weekend factors are specific to equipment type only and do not vary geographically (U.S. Environmental Protection Agency, 1999b).
- Annual equipment usages (hours of use) are based on a 1998 PSR equipment activity database. The application-specific estimates in this database were based on several yearly surveys of equipment owners conducted by PSR (U.S. Environmental Protection Agency, 2002b).
- Default engine load factors were based on a simplifying assumption that the EPA's recreational marine engine test cycle is representative of load factors for engines in use. Although PSR survey results for load factors exist, they are not represented in the NONROAD model because the EPA considered them to be insufficiently documented (U.S. Environmental Protection Agency, 2002b).

Because NONROAD relies primarily on national-level activity data, some regional and/or local equipment population and usage characteristics are likely not properly represented in the model. Moreover, the use of water surface area as a geographic allocation surrogate does not account for the navigability of a given body of water or its popularity. Improving the various types of activity data utilized by NONROAD required gathering additional information about the ownership and use of recreational boats within the CENRAP region.

6.2.2 Acquisition of Activity Data

The activity data needed to update the NONROAD inputs for recreational boats were gathered through a bottom-up survey of representative groups of recreational boat owners. The survey was designed to gather data on vessel characteristics, hours of use, fuel consumptions, engine loads, and temporal and geographic usage patterns in each CENRAP state. A representative pool of nearly 1,400 registered boat owners was recruited by telephone to participate in the study. A survey questionnaire and an incentive for participation was mailed to

each participant, followed one week later by a reminder postcard. For the purposes of study design, a 50% return rate was anticipated for the mail survey; however, a significantly better response rate—more than 70%—was actually achieved. Geographic coverage and representativeness of the survey results were considered to be excellent for all states of the CENRAP region. Survey results were analyzed and used to estimate annual hours of use and engine load factors for each state and each type of boat. Survey questionnaires, results, and raw data files are included as an appendix to the Final Report.

6.2.3 Spatial Allocation

In order to spatially allocate emissions, the counties where recreational boats are used should be determined (i.e., the county where the boat is registered is not a good spatial surrogate). The survey questionnaire included one or more maps detailing the navigable waterways in the respondents' region, which allowed respondents to easily identify the counties in which they typically operate their boats. (Participants indicated their regions during telephone recruitment.) These responses were converted and used to calculate county-level activity for recreational boats.

6.2.4 Temporal Allocation

The survey questionnaire also queried how recreational boat activity is distributed across the months of the year, the days of the week, and the hours of the day. Large variances in climate and boating habits throughout the CENRAP region meant that these temporal patterns were likely to vary greatly from state to state. Responses to these questions were analyzed and used to calculate seasonal, day-of-week, and diurnal temporal profiles for each state and type of boat.

6.2.5 Data Preparation

Deliverables for this source category included the updated input files used to run the NONROAD model, as well as county-level emission estimates derived from outputs of the latest version of NONROAD (NONROAD 2004). These emission estimates were provided in both NIF 3.0 format and the IDA format used by the SMOKE emissions model. The temporal allocation profiles and cross-reference files used by SMOKE were also provided.

6.3 MARINE VESSELS

Emissions estimates were prepared for commercial marine vessels operating in commercially active waterways in the CENRAP region. This inventory included river barges and other commercial vessels operating in inland waterways, as well as ocean-going ships, harbor tugboats, and other commercial vessels operating in the Gulf Intracoastal Waterway (GIWW). These waterways can be seen in **Figure 6-1** (U.S. Army Corps of Engineers, 1997).

Figure 6-1. Map of commercially active inland and intracoastal waterways in the United States.

6.3.1 Emission Factors

In 1999, the EPA released a Regulatory Impact Analysis (RIA) on commercial marine vessel emissions (U.S. Environmental Protection Agency, 1999e). This report estimated emissions for the three categories of marine engines shown in **Table 6-3**:

Table 6-3. EPA marine engine categories.

Category	Displacement per Cylinder	Description
1	disp. < 5 liters power ≥ 37 kW	Similar to land-based non-road engines. Used in smaller tugboats, ferries, fishing vessels, and dredges. Fueled by marine diesel oil.
2	5 ≤ disp. < 30 liters	Similar to engines used in locomotives. Used in smaller ocean-going vessels, as well as large tugboats, towboats, ferries, and fishing vessels. Fueled by marine diesel oil.
3	disp. ≥ 30 liters	Used primarily for propulsion in large, ocean-going vessels. Usually fueled by residual oil, which has a higher sulfur content than diesel oil.

In addition to the uses cited in Table 6-3, all three categories of engines can be used for "auxiliary" purposes (such as electrical generation) on larger vessels, though Category 2 engines are used in this way more often than the other types. The EPA RIA estimated emission factors for Category 1 marine engines and cited emission factors for Category 2 and 3 marine engines from a previous EPA report (U.S. Environmental Protection Agency, 1998c). **Tables 6-4 and 6-5** show the emission factors for marine engines in each category.

Table 6-4. Emission factors for Category 1 marine engines.

Power Range (kW)	HC (g/kW-hr)	NO_x (g/kW-hr)	CO (g/kW-hr)	PM (g/kW-hr)
37 – 75	0.27	11	2.0	0.9
75 – 130	0.27	10	1.7	0.4
130 – 225	0.27	10	1.5	0.4
225 – 450	0.27	10	1.5	0.3
450 – 560	0.27	10	1.5	0.3
560 – 1000	0.27	10	1.5	0.3
1000+	0.27	13	2.5	0.3

Table 6-5. Emission factors for Category 2 and 3 marine engines.

Engine Speed[1]	HC (g/kW-hr)[2]	NO_x (g/kW-hr)	CO (g/kW-hr)	PM (g/kW-hr)
Medium[2]	0.5	12	1.6	0.25
Slow[2]	0.5	17	1.4	1.48

[1] Category 2 and smaller Category 3 engines are medium speed (2-stroke). Larger Category 3 engines are slow speed (4-stroke).
[2] Emission factors converted from kilograms per ton of fuel consumed to gram per kilowatt-hour using fuel consumption estimates of 195 g/kW-hr for slow speed engines and 210 g/kW-hr for medium speed engines (Pollack et al., 2004).

Emission factors for SO_2 were calculated using Equation 6-1, an algorithm that is based on fuel sulfur content (U.S. Environmental Protection Agency, 2000). **Table 6-6** lists the assumed fuel sulfur content (U.S. Environmental Protection Agency, 2003b) for marine diesel oil and residual oil, as well as the SO_2 emission factors calculated for each engine type.

Emission rate (g/kW-hr) =
2.3735* [Fuel Consumption (in g/kW-hr) * Fractional Fuel Sulfur content] **(6-1)**

Table 6-6. SO_2 emission factors for marine engines.

Engine Type	Fuel Sulfur Content	SO^2 (g/kW-hr)
Category 1		
<1000 hp	0.25%	1.29
>1000 hp	0.25%	1.25
Category 2 and 3		
Medium speed	0.25%/2.70%[a]	1.25/13.46[a]
Slow speed	2.70%	12.5

[a] The first value is for marine diesel oil, which is used in Category 2 engines, and the second value is for residual oil, which is used in Category 3 engines.

These emission factors can also be converted to fuel-based factors by dividing them by the fuel consumption rate for a given engine type. For example, the SO_2 emission factor for slow-speed Category 3 engines can be converted to a fuel basis as follows:

Fuel-based emission rate = (12.5 g/kW-hr / 195 g/kW-hr) * 1000 g/kg = 64.1 g/kg of fuel **(6-2)**

6.3.2 Acquisition of Activity Data

Emissions estimates were based primarily on bottom-up fuel usage data for inland river systems in the CENRAP region derived from the Tennessee Valley Authority (TVA) Barge Costing Model. This model was developed to estimate fuel usage by inland river segment for fuel tax purposes.[6] Inputs to the model include engine horsepower and trip characteristics for each vessel that travels on a given waterway segment in a given year. These data are used to estimate fuel consumption for each significant inland waterway segment in the United States.[7] The model uses these data to estimate total fuel consumption, total cargo transported, and average vessel horsepower by waterway segment. Each year, fuel consumption estimates are compared to actual tax receipts, and model errors have averaged only 1.5% per year since 1996.

For the GIWW, however, the TVA model does not provide a complete picture of fuel consumption, as “deep-draft” (oceangoing), harbor tugs, and other vessels not bound for an inland river system are not considered. For these vessels, emission estimates were prepared with work-based emission factors and the following types of activity data (U.S. Environmental Protection Agency, 1999a):

- The number of total trips to and from each port
- The total number of trips passing (but not stopping at) each port

[6] Some “segments” consist of an entire river, such as the Atchafalaya River in Louisiana. Longer rivers, such as the Mississippi, are broken up into multiple segments.
[7] The small rivers and tributaries not considered by the model account for only 1-3% of the total tonnage moved over inland waterways each year (Dager, 2004).

- Vessel characteristics for tugboats and transport ships operating in and through each port
- Speed and time-in-mode data for four operational modes: cruise, slow cruise, maneuvering, and hoteling (or docking)
- Engine load factors for each of the four operational modes listed above

Much of the necessary data on vessel trips can be obtained from the U.S. Army Corps of Engineers (USACE) Waterborne Commerce Statistics Center, which tracks vessel movements and characteristics, as well as barge trips and tonnage. The Maritime Administration of the Department of Transportation also maintains a U.S. waterway database that includes vessel names and ports/waterways visited.

Vessel characteristics, speeds, times-in-mode, and engine load data have been modeled for deep sea, river, and Great Lake ports in the United States in a two-volume report produced by ARCADIS on behalf of the EPA (U.S. Environmental Protection Agency, 1999a, d). These documents provide a detailed analysis of selected ports, as well as a method for extrapolating activity data from these "known" ports to other ports with similar characteristics. Several of the ports chosen for detailed analysis are located within the CENRAP region, including St. Louis, Baton Rouge, New Orleans, Plaquemines, South Louisiana, and Corpus Christi. The techniques described in these reports were used to produce a profile of vessel characteristics and operations for all ports in the CENRAP states. Also, some bottom-up surveys of selected port authorities and/or vessel operators were done to verify the assumptions made in creating these profiles.

6.3.3 Spatial Allocation

Emissions occurring in and around a deep sea or Great Lake port area were assigned to the county in which the port is located. If a port spanned multiple counties, the number of port terminals in each county was used to allocate maneuvering and hoteling emissions, and the length of the port area in each county was used to allocate emissions from cruise mode. Data on port terminals and their waterway locations are available from the USACE (2003a).

However, for inland river systems, fuel consumption must first be disaggregated into "in-port" and "underway" components. To accomplish this, fuel consumption at river ports in the CENRAP states was estimated with fuel-based emission factors described in Section 6.3.1 and port-specific data on vessel trips; and characteristics (as outlined in Section 6.3.2) were obtained from USACE data, EPA guidance documents, and surveys of port authorities. Once in-port fuel consumption was estimated, the values were subtracted from Barge Costing Model fuel consumption estimates for the river segment in question. The remaining fuel consumption was considered "underway" and allocated to counties based on the fraction of a river segment's length passing through each county. These county-level river segment fractions were derived from the GIS-based National Waterway Network database produced by the Bureau of Transportation Statistics (BTS).

6.3.4 Temporal Allocation

Monthly variations in vessel activity and fuel usage are significant (Dager, 2004). These seasonal variations are influenced by climate (the upper Mississippi is closed during winter) and by the types of commodity being moved (grain shipments, for example, primarily occur in April/May and September/October).

Fuel usage estimates produced by the Barge Costing Model are not currently available on a monthly basis. Therefore, monthly activity patterns were determined from the Lock Performance Monitoring System (LPMS) maintained by the USACE. This database provides USACE operators, planners, and managers with information on the use, performance, and characteristics of the USACE's national system of locks. The LPMS consists of data collected at most USACE-owned and/or -operated locks, including the number of vessels and barges locked, dates of lockages, and the type and tonnage of commodity carried (U.S. Army Corps of Engineers, 2003b). Statistics are published monthly for selected key locks, and these monthly data were used to generate a monthly activity profile for each inland river system, as well as the GIWW.

6.3.5 Data Preparation

Deliverables for this source category include the county-level emission estimates in both NIF 3.0 format and the IDA format used by the SMOKE emissions model. The temporal allocation profiles and cross-reference files used by SMOKE were also provided.

6.4 LOCOMOTIVES

Railroads can be separated into three class sizes. Class I railroads operate over a large geographic area, serve many states, and maintain fleets of locomotives that number from several hundred to several thousand. These railroads, while few in number, are responsible for about 93% of the annual fuel consumption of all railroads nationwide (U.S. Environmental Protection Agency, 1998d). Class II (or regional) railroads serve only a few states and typically operate about 30 to 200 locomotives. Class III (or local) railroads usually serve only one state and operate only a handful of locomotives. Locomotives in each of these classifications can be used for two types of operation: line haul and yard (or switching) activities. Line haul locomotives generally travel long distances, whereas yard locomotives only move railcars within a local railway yard. Some local railroads do not operate any line haul locomotives, but only provide switching services to other railroads. These "Switching and Terminal" railroads were treated as a fourth classification for emission estimation purposes.

Table 6-7 shows the total number of railroads operating in the entire CENRAP region by class (Association of American Railroads, 2004). Using the emission factors and activity data described in the following sections, emissions were estimated for all line haul and yard locomotives operated by one of these railroads.

Table 6-7. Railroads operating in the CENRAP region by class.

Railroad Class	Number of Railroads	Railroad Names
Class I	8	Amtrak Burlington Northern & Sante Fe Kansas City Southern Union Pacific Norfolk Southern CSX Transportation Canadian National Canadian Pacific/Soo Line
Class II	14	Chicago, Central & Pacific Dakota, Minnesota & Eastern Duluth, Missabe & Iron Range I & M Rail Link Iowa Interstate Kansas City & Oklahoma Kyle Missouri & Northern Arkansas Nebraska, Kansas & Colorado Northern Plains Red River Valley & Western South Kansas & Oklahoma Texas Mexican Texas Pacifico
Class III	80	Numerous
Switching & Terminal	33	Numerous

6.4.1 Emission Factors

Emissions from locomotives are calculated based on fuel consumption. The EPA has estimated average emissions rates for locomotives as grams of pollutant emitted per gallon of fuel consumed (g/gal) (U.S. Environmental Protection Agency, 1997). These emission factors vary by the age of the locomotive, as three separate sets of emissions standards have been adopted by the EPA (see **Table 6-8**).

Table 6-8. Locomotive emission factors by model year.

Locomotive Type	Model Year	Controls	Emission factors (g/gal)			
			HC	CO	NO^x	PM
Line haul	<1973	Uncontrolled	10	26.6	270	6.7
	1973-2001	Tier 0	10	26.6	178	6.7
	2002-2004	Tier 1	9.8	26.6	139	6.7
	>2004	Tier 2	5.4	26.6	103	3.6
Switch	<1973	Uncontrolled	21	38.1	362	9.2
	1973-2001	Tier 0	21	38.1	262	9.2
	2002-2004	Tier 1	21	38.1	202	9.2
	>2004	Tier 2	11	38.1	152	4.3

For Class I railroads, weighted emission factors were calculated based on locomotive fleet age distribution data available from the Bureau of Transportation Statistics (Bureau of Transportation Statistics, 2003a). The latest BTS locomotive fleet information indicates that 14% of Class I locomotives were built prior to 1973 and 86% were built from 1973 to 2001 (and are, therefore, subject to Tier 1 controls). At the time of data acquisition, no information was available on the number of locomotives built in 2002 that have entered the fleet; so for purposes of the 2002 inventory, it was assumed that the impact of Tier 1 controls is negligible. The weighted emission factors shown in **Table 6-9** were calculated based on the BTS fractions listed above.[8]

Table 6-9. Weighted emission factors for Class I locomotives.

Locomotive Type	Emission factors (g/gal)			
	HC	CO	NO_x	PM
Line haul	10	26.6	191	6.7
Switch	21	38.1	273	9.2

For Class II, Class III, and switching railroads, no specific information on fleet age distributions is readily available, and since these railroads use only about 5% of the fuel consumed by all railroads nationwide (U.S. Environmental Protection Agency, 1998d), a simple, conservative approach was applied. Because it is known that these smaller railroads tend to have an older fleet mix than Class I railroads (U.S. Environmental Protection Agency, 1992), uncontrolled emission factors were applied to all Class I, Class II, and switching railroads.

[8] For purposes of this calculation, it was assumed that fuel usage per locomotive does not vary with age, either due to fuel economy changes or the reduced usage of older locomotives.

6.4.2 Acquisition of Activity Data

Class I Railroads

Class I line haul locomotives, which operate over large geographic regions, do not burn all their fuel in the same area where the fuel was pumped. Therefore, total annual fuel consumption for each Class I railroad must be estimated at the state (or county) level in order to determine the amount of fuel consumed within the inventory area. Such estimates were made by calculating a system-wide fuel consumption index (expressed in gross ton-miles[9] per gallon or GTM/gal) for each railroad and applying that index to state-level traffic density data (U.S. Environmental Protection Agency, 1992). As a quality assurance check, Class I railroads were contacted individually to see if they track state or county-level fuel consumption data that could be compared to the estimated values.

The data needed to calculate a fuel consumption index can be obtained from the "R-1" reports all Class I railroads are required to file with the Surface Transportation Board (STB) each year. Schedule 755 of this report lists the annual traffic density in gross ton-miles for a given railroad, and Schedule 750 lists the total fuel consumption for line haul operations and switching operations. Copies of these schedules for all Class I railroads were obtained from the STB, and **Table 6-10** lists the 2002 traffic density and fuel consumption data for each Class I railroad operating in the CENRAP region.

Table 6-10. 2002 system-wide activity data for Class I railroads.

Railroad Name	Traffic Density (1000 ton-miles)	Fuel Consumption (gal)	
		Line Haul	Switching
Amtrak[a]	N/A	75,000,000	N/A
Burlington Northern and Sante Fe	958,862,994	1,091,248,247	57,434,118
Kansas City Southern	37,563,933	51,256,604	4,057,180
Union Pacific	1,085,700,525	1,176,963,998	137,902,327
Norfolk Southern	373,281,203	433,678,710	38,810,939
CSX Transportation	469,392,729	514,107,567	56,172,596
Canadian National	104,578,305	108,013,647	15,135,382
Canadian Pacific/Soo Line	45,426,616	42,198,000	3,060,000

[a] Amtrak does not file reports with the STB, so fuel consumption data for that railroad was obtained from the BTS (2003b).

Using these data, a fuel consumption index for each railroad was calculated by dividing the system-wide traffic density by the system-wide fuel usage. For example, the fuel consumption index for the Burlington Northern & Sante Fe (BNSF) railroad was calculated as follows:

$$FCI_{BNSF} = 958{,}862{,}994 \times 10^3 \text{ ton-miles} / 1{,}091{,}248{,}247 \text{ gal} = 878.7 \text{ ton-miles/gal} \qquad \textbf{(6-3)}$$

[9] Gross ton-miles include the weight of locomotives, freight cars, etc. rather than the weight of freight only.

State-level traffic density data were obtained from the Federal Railroad Administration (FRA), as Class I railroads are only required to report their traffic density to the STB on an aggregate (or national) basis. The FRA has a rail network model which is used to estimate traffic flows on specific rail lines, and the agency provided state-level traffic density data for all Class I railroads (Kedar, 2004). These data can be used in conjunction with the fuel consumption index calculations described above to estimate fuel usage by state for each Class I railroad. For example, FRA data show that the 2002 gross traffic density for the BNSF Railroad in Arkansas was 8090.66 million ton-miles. Fuel usage for this railroad in Arkansas can then be calculated as follows:

$$\text{Fuel Consumption} = 8090.66 \times 10^{6} \text{ ton-miles} / 878.7 \text{ ton-miles/gal} = 9{,}207{,}696 \text{ gal} \qquad \textbf{(6-4)}$$

Class I switching emissions were also calculated based on fuel usage data gathered from Class I railroads or taken from R-1 reports. These data were disaggregated to the state level using procedures similar to those outlined above, with a fuel consumption index generated for each railroad by dividing the railroad's system-wide traffic density by the system-wide fuel usage for switching operations.

Class II and Class III Railroads

Emissions from Class II and III locomotives were calculated based on the amount of fuel consumed in the inventory area. However, these smaller railroad companies are not required to file R-1 reports with the STB, so the only source of fuel consumption information is the railroads themselves. Because there are only 14 Class II (regional) railroads operating in the CENRAP states, each one was surveyed to determine fuel usage by state. In cases where Class II railroads are unable or unwilling to provide data, an average fuel consumption index was calculated for railroads that did supply information and extrapolated to railroads with missing data. This fuel consumption index was based on the total miles of track operated by a railroad and the total carloads of freight transported each year—information gathered through annual surveys conducted by the Association of American Railroads (AAR).

A similar approach was used for Class III railroads. Surveying each of the 80 local railroads in the CENRAP states individually was not feasible within the scope of this project, so a sample of such railroads was contacted in each state. Again, a fuel consumption index was calculated from available data and used to estimate fuel usage for railroads that were not surveyed.

Switching and Terminal Railroads

For yard (or switching) locomotives, the EPA recommends an emission estimation method based on the number of yard locomotives operating within an inventory area. The EPA estimates that the average yard locomotive operates 24 hours per day, 365 days per year, and consumes 228 gallons of diesel fuel per day (U.S. Environmental Protection Agency, 1992). Yard locomotive emissions can be derived by multiplying the number of yard locomotives within the inventory area by this fuel usage factor and applying the switch locomotive emission factors previously cited. However, these assumptions indicate that the typical yard locomotive consumes over 80,000 gallons of fuel per year, and, while this figure may be appropriate for

busy Class I yard locomotives, it is almost certainly too high for local switching operations.[10] Therefore, fuel usage for switching railroads was calculated in a manner similar to that carried out for other Class III railroads. A sample of switching railroads was contacted to obtain annual fuel usage data, and a fuel consumption index was derived and applied to other railroads. This fuel consumption index was based on the number of yard locomotives and total miles of track operated, as well as the number of carloads of freight handled each year—information available from the AAR.

6.4.3 Spatial Allocation

For Class I railroads, emissions were apportioned to the county level by using the GIS-based National Rail Network produced by BTS. This network contains traffic density data[11] by railway segment and railroad classification, and the network can be overlaid with county boundaries to estimate the fraction of a given state's Class I rail traffic that passes through each county in that state. These fractions were used to disaggregate emissions from the state to the county level. Similarly, state-level emissions from switching operations were assigned to individual counties based on the number of railroad terminals[12] in a given county.

For Class II and III railroads, emission factors for line haul locomotives[13] were applied to statewide fuel usage estimates for Class II and III railroads, and emissions were apportioned to the county level using the Class II and III traffic density data contained in the National Rail Network. For Class III switching operations, emission factors for switching locomotives were applied to fuel usage estimates, and the emissions were apportioned to the county in which each railroad's yard is located.

6.4.4 Temporal Allocation

Movements of freight by rail occur 24 hours per day, 7 days per week, though there are slight variations across the months of the year (Kedar, 2004). The AAR produces an annual report that summarizes weekly carloads of freight shipped in the United States, and these weekly data were used to model monthly variations in locomotive activity (American Association of Railroads, 2003).

---

[10] Preliminary data collected for Iowa show that two local switching railroads consume less than 10,000 gallons of diesel fuel per year each.

[11] Each rail segment is assigned to one of seven density groupings (for example, Group 2 represents densities ranging from 5.0 to 9.9 million GTM/mile). The average of each range will be used when apportioning traffic density to the county level.

[12] The BTS National Rail Network contains data on the locations of railroad terminals and junctions in each state.

[13] Class II and III railroads are not as likely as Class I railroads to operate their own switching engines or to track fuel by locomotive type. This assumption was also made by the EPA in a regulatory support document (U.S. Environmental Protection Agency, 1998d).

6.4.5 Quality Assurance

For Class I railroads, fuel consumption estimates by state from the FRA rail network model were cross-checked with other readily available estimates of railroad activity as a quality assurance check. For example, the state-level data published by the AAR list the total tons of freight transported through each state annually (Association of American Railroads, 2004). These data show that freight traffic in Nebraska is significantly higher in than any of the other CENRAP states, which corroborates initial fuel estimates performed for Class I railroads from available STB data.

For Class II and III railroads, survey data gathered in 2001 by the American Shortline and Regional Railroad Association (ASRRA) were used as a quality assurance check. This survey included questions related to fuel consumption; and while confidentiality concerns prevent the release of the actual database, a researcher with ASRRA provided an aggregate estimate of fuel consumed by all Class II and III railroads headquartered in CENRAP states for 2001 (Benson, 2004). This estimate of 50,000,000 gallons matches up very well with the results of the CENRAP inventory.

In addition, the procedures outlined in the project QAPP were followed (Sullivan, 2004).

6.4.6 Data Preparation

Deliverables for this source category include the county-level emission estimates in both NIF 3.0 format and the IDA format used by the SMOKE emissions model. The temporal allocation profiles and cross-reference files used by SMOKE were also provided.

7. METHODS TO ESTIMATE EMISSIONS FOR SOURCES OF AGRICULTURAL FUGITIVE DUST

Agricultural operations, such as crop tilling, crop harvesting, or confined animal feeding operations (CAFOs), release emissions of geologic fugitive dust. This section describes the information sources and methods used to calculate county-level emissions of agricultural fugitive dust for the CENRAP region for calendar year 2002.

7.1 PRIORITIZATION

Emissions estimation methodologies and existing emission inventories for the CENRAP region and for other regions of the country were reviewed. The EPA's 1999 NEI includes particulate matter (PM) emissions for the CENRAP region for the following agricultural source categories, as illustrated in **Figure 7-1**: tilling, beef cattle feedlots, cotton ginning, and agricultural crop burning (U.S. Environmental Protection Agency, 2004b). The Western Regional Air Partnership (WRAP) projected emissions from the 1999 NEI to estimate 2002 agricultural PM emissions for the WRAP region (E.H. Pechan and Associates, 2004). The WRAP region's inventories indicated that agricultural tilling and beef cattle feedlots were the largest contributors to agricultural fugitive dust, followed by crop transport and cotton ginning, as illustrated in **Figure 7-2**. Other sources of agricultural PM emissions in the WRAP region included harvesting, crop burning, and other combustion sources.

In the NEI and WRAP inventories, agricultural tilling and CAFOs encompass more than 90% of the PM emissions from agricultural sources. Therefore, agricultural tilling and CAFOs were selected for bottom-up treatment. Emissions of PM_{10} and $PM_{2.5}$[14] for these source categories were estimated by acquiring bottom-up activity data and applying emission factors from EPA guidance or other literature. Activity data for agricultural tilling operations were gathered through a survey of county agricultural extension offices (Reid et al., 2004). Facility-specific population estimates for beef cattle feedlots and dairies were prepared previously (Coe and Reid, 2003).

[14] PM_{10} is PM of less than or equal to 10 microns (μm) aerodynamic matter. $PM_{2.5}$ is PM of less than or equal to 2.5 microns (μm) aerodynamic matter

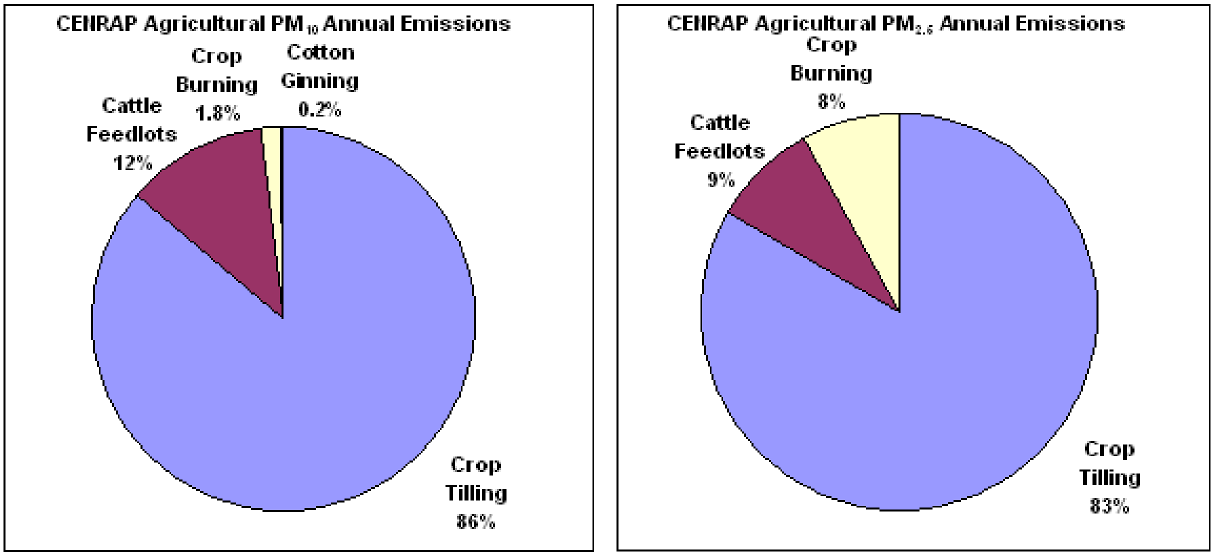

Figure 7-1. 1999 agricultural PM emissions for the CENRAP region.

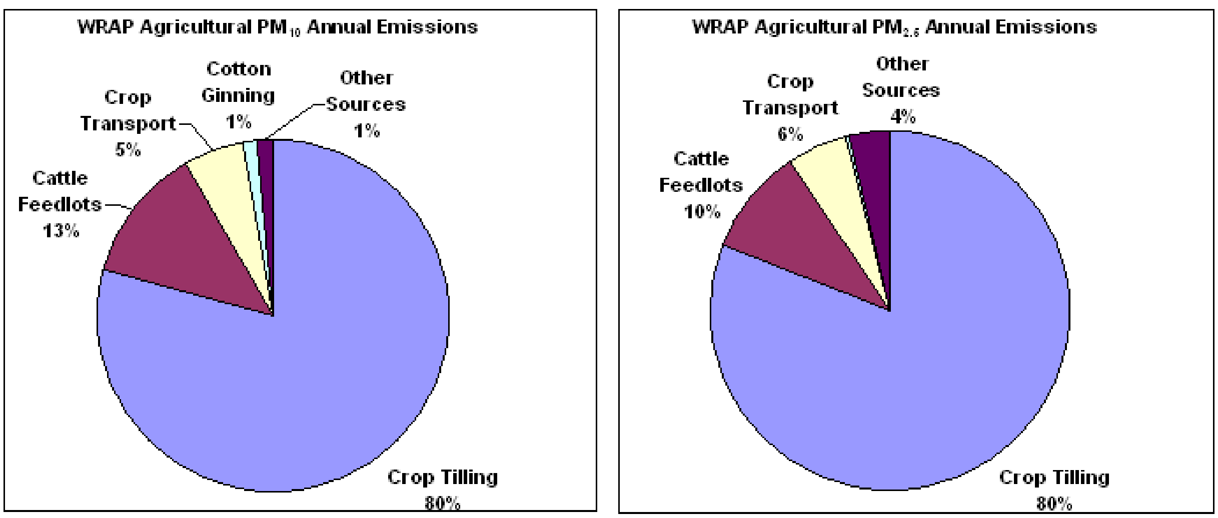

Figure 7-2. Projected 2002 agricultural PM emissions for the WRAP region.

7.2 AGRICULTURAL CROP TILLING

EPA's guidance for estimating PM emissions from agricultural crop tilling involves combining a constant emission factor with county-level activity data, including the silt content of surface soils, the number of tillings performed in a year for each crop type, and the acres of each crop type (U.S. Environmental Protection Agency, 2001, 2004c). For conservational tillage practices, such as no till, mulch till, and ridge till, the number of tillings performed in a year is reduced proportionally according to information provided by the Conservation Information

Technology Center (CTIC) (U.S. Environmental Protection Agency, 2004c; Conservation Technology Information Center, 2004). Emissions from agricultural crop tilling are calculated according to Equation 6-1.

$$E = c \times k \times s^{0.6} \times p \times a \qquad \textbf{(6-1)}$$

E represents the PM emissions in units of pounds per year, and *c* equals the constant emission factor of 4.8 lbs/acre-tilling. A dimensionless particle size multiplier, *k*, is applied to calculate either PM_{10} (k=0.21) or $PM_{2.5}$ (k=0.042). The silt content of the soil, *s*, is defined as the mass fraction of particles smaller than 0.75 µm diameter found in soil to a depth of 10 cm, expressed as a percent. The other activity data include *p*, which represents the number of tillings or passes that are performed in a year for each crop type, and *a*, which represents the acres of land tilled for each crop type. In summary, the methodology requires the following information, at county level, as activity data:

- The number of tillings per year by crop.
- The conservational tilling practices.
- The silt content of soils.
- The acres of land planted by crop type .

The EPA's Emissions Inventory Improvement Program suggests that local data for the number of tillings per year for each crop type and the temporal distribution of tilling activities are desirable (U.S. Environmental Protection Agency, 2004c). A survey of tilling practices was conducted by contacting county agricultural extension offices throughout the CENRAP region (Reid et al., 2004). Questionnaires were designed to elicit information about the types of crops in each respondent's county and the tilling practices for each crop type. The survey results were analyzed and extrapolated for each of the CENRAP states to estimate the number of tillings per year by crop type, the temporal distributions of temporal tilling activities, and the prevalences of conservational tilling practices.

The EPA National Air Pollutant Emission Trends Procedures Document provides a cross-reference table with silt contents for various soil types (U.S. Environmental Protection Agency, 1998b). The State Soil Survey Geographic Database (STATSGO) produced by the Natural Resources Conservation Service of the United States Department of Agriculture was used to determine soil types at the county level (National Resources Conservation Service, 1994). County-level silt contents were determined by using the EPA Procedures Document to cross-reference silt contents with STATSGO soil types.

County-level acreages of grown crops were prepared previously (Reid et al., 2004). These acreages were based on 2002 National Agricultural Statistics Service (NASS) data.

7.3 CATTLE FEEDLOTS AND DAIRIES

The open surfaces of the pens and/or the manure pack are sources of fugitive dust at cattle feedlots and dairies. The major difference between cattle feedlots and dairies is the proportion of time that herds are in contact with the manure pack, which tends to limit fugitive

dust emissions at dairies to levels much lower than those of beef cattle feedlots (Goodrich et al., 2002).

EPA guidance specifies an emission factor equal to 17 tons of PM_{10} per thousand head of feeding cattle per year (or 93 lbs PM_{10} per thousand head per day), and an assumption that 15% of PM_{10} is emitted as $PM_{2.5}$ (U.S. Environmental Protection Agency, 2004a). However, a literature review indicated that the EPA's guidance results in greatly overestimated emission inventories (Flocchini and James, 2001; Goodrich et al., 2002). Two recent studies performed by the University of California at Davis and Texas A&M University yielded emission factors of 28.9 lbs PM_{10} per thousand head per day (Flocchini and James, 2001) and 19 lbs PM_{10} per thousand head per day (Goodrich et al., 2002) for beef cattle at feedlots. The midpoint—24 lbs PM_{10} per thousand head per day—was selected and used to estimate emissions of PM_{10} for beef cattle feedlots in the CENRAP region. In addition, an emission factor of 4.4 lbs PM_{10} per thousand head per day was selected for use in estimating emissions for dairies. This emission factor is based on sampling conducted at a single central Texas dairy in the summer of 2002 (Goodrich et al., 2002), and is therefore highly uncertain. However, it is the best and most reasonable emission rate that could be identified at this time.

Facility-specific population estimates for beef cattle feedlots and dairies were prepared previously (Coe and Reid, 2003). These population estimates were based primarily on facility-specific animal populations and species available from National Pollutant Discharge Elimination System (NPDES).

No information was identified that could be used to develop temporal patterns for this source category. However, emissions are likely to vary because climate conditions and animal husbandry practices vary seasonally and diurnally.

7.4 DATA PREPARATION

Deliverables for this source category include the county-level emission estimates in both NIF 3.0 format and the IDA format used by the SMOKE emissions model. The temporal allocation profiles and cross-reference files used by SMOKE were also provided.

8. PREPARATION OF INVENTORIES AND DATA FILE SYSTEMS FOR DELIVERY

8.1 ON-ROAD MOBILE SOURCES

Activity data, MOBILE6-ready input files, temporal profiles and cross-references used by SMOKE, and MOBILE6 command files were prepared to allow an independent third party to run MOBILE6 within SMOKE. These deliverables permitted CENRAP to prepare hourly meteorological inputs, estimate emissions, and prepare gridded emission inventories for any 2002 time period. In addition, STI ran MOBILE6 within SMOKE, estimated annual emissions for on-road mobile sources, and prepared NIF 3.0 emission inventories for the entire CENRAP region.

To estimate annual emissions, CENRAP's MM5 meteorological inputs for the months of January and July 2002 were used. Annual emissions were estimated from the average of the emission inventories for January and July 2002.[15] In addition, although SMOKE/MOBILE6 can be used to calculate emissions from refueling, these emissions are better allocated spatially and temporally if they are calculated separately from MOBILE6 runs. Therefore, refueling emissions were not included in the CENRAP emission inventory.

8.2 NON-ROAD MOBILE SOURCES

Revised activity data files and fuels characteristics, formatted for use with NONROAD, were prepared to allow an independent third party to run NONROAD and estimate emissions. In addition, STI ran the latest version of NONROAD (NONROAD 2004), estimated annual emissions for non-road mobile sources, and prepared NIF 3.0 and IDA-formatted emission inventories for the entire CENRAP region. The temporal allocation profiles and cross-reference files used by SMOKE were also provided. Emissions for locomotives and commercial marine vessels were estimated externally to the NONROAD model, which does not treat these sources, and were prepared in NIF 3.0 and IDA formats.

8.3 SOURCES OF AGRICULTURAL FUGITIVE DUST

STI estimated annual emissions for sources of agricultural fugitive dust, and prepared NIF 3.0 and IDA-formatted emission inventories for the entire CENRAP region. For agricultural tilling dust, the temporal allocation profiles and cross-reference files used by SMOKE were also provided.

[15] Test runs were also completed using representative temperatures for April and October to determine the potential effects on the annual average; however, the effects of including four months in the annual average were negligible.

Final Report

Overview

Population Research Systems (PRS), LLC, a subsidiary of Freeman, Sullivan & Co., conducted the Pleasure Craft Survey for the Central States Regional Air Planning Association (CENRAP) Study in July 2004 on behalf of Sonoma Technologies, Inc. The project, which was sponsored by CENRAP, was designed to quantify air pollutant emissions from pleasure craft activities in the states of Nebraska, Kansas, Oklahoma, Arkansas, Texas, Iowa, Minnesota, Missouri and Louisiana.

Sonoma Technology, Inc. and PRS collaborated closely on the development of the mail survey instrument (Appendix B) used for this project. PRS was responsible for printing and mailing of the mail survey, the personalized cover letter (Appendix C), four-color state waterway maps as well as for programming of the telephone recruitment screener used by the PRS computer-assisted telephone interviewing (CATI) laboratory.

All project files and an electronic copy of this report can be found on the enclosed CD-Rom in Appendix D.

Methods

A. Sample

PRS purchased commercially available sample of registered boat owners in the target states from Dunhill International. Altogether 17,454 records of boat owners were loaded into the CATI system, 2,000 randomly drawn records per state. The only exception was Oklahoma, were the total number of available and loaded sample points was 1,454 records. Out of all records, 16,878 records were attempted, and 577 were not attempted, since some state quota cells were filled

without calling all available records. Table 1. shows the number of sample points available per state.

Table 1. Number of loaded sample points per CENRAP state

STATE	Frequency
AR	2,000
IA	2,000
KS	2,000
LA	2,000
MN	2,000
MO	2,000
NE	2,000
OK	1,454
TX	2,000
Total	17,454

B. Telephone Recruit and Survey Package Mailing

Potential participants for the Pleasure Craft Study were recruited over the phone in a brief 10 minute interview (Appendix A).

Respondents were recruited from May 20, 2004 through June 10, 2004. All recruits were conducted by trained PRS CATI laboratory interviewers on weekdays between 5:00 PM and 9:00 PM Central Standard Time. At a respondent's request, PRS also scheduled callback appointments outside of these interviewing hours.

A maximum of four call attempts were made to each sample point and no refusal conversions were used to convince eligible respondents to participate in the study.

Once a respondent agreed to participate, a survey package containing a personalized letter, a pen-and-paper survey, waterway map(s) for the state respondent is using motorized watercraft, a business reply envelope and a safety whistle on a floating lanyard as incentive were mailed.

About two weeks after the initial survey mailing, a reminder postcard was sent to respondents who had not yet returned their surveys.

C. Results

PRS recruited 1,387 respondents for the mail survey, and 979 completed surveys were returned. Table 2 shows the distribution of recruits and returned surveys per state, as well as the respective

percentage of response rate per state. The response rate varied between 67.4% and 77.1% and averaged at a return rate of 70.6%.

Table 2. Number of recruits and completed interviews per state

STATE	recruited	returned	%
AR	158	111	70.3%
IA	153	118	77.1%
KS	160	107	66.9%
LA	153	105	68.6%
MN	160	115	71.9%
MO	157	113	72.0%
NE	152	110	72.4%
OK	135	91	67.4%
TX	159	109	68.6%
Totals	**1387**	**979**	**70.6%**

APPENDIX A

TELEPHONE RECRUIT SCREENER

CENRAP Boating Study, Project 1031
Telephone Recruitment Script

INTRO1
Hello, my name is <interviewer>, may I speak with <insert fname, lname>?
1. On the phone (skpto INTRO3)
2. No, respondent is coming to the phone (skpto INTRO2)
3. No, respondent is not at home (schedule callback)
4. No such person (skpto TERM1)

INTRO2
Hello, my name is <interviewer> and I'm calling on behalf of CENRAP, the Central States Regional Air Planning Association. CENRAP is an organization of states, tribes, federal agencies, and other interested parties that studies and addresses air pollution, regional haze and visibility issues. Your state is participating in CENRAP and as such, you have been randomly selected to participate in an important air quality study. (Skpto INTRO4)

INTRO3
Hi, I'm calling on behalf of CENRAP, the Central States Regional Air Planning Association. CENRAP is an organization of states, tribes, federal agencies, and other interested parties that studies and addresses air pollution, regional haze and visibility issues. Your state is participating in CENRAP and as such, you have been randomly selected to participate in this important air quality study.

INTRO4
This telephone interview will take only a few minutes and I can assure you that I am not selling anything. We are conducting a study about recreational boating activities and are interested in learning more about how people use their watercrafts. All of your answers will be confidential and not used for any purpose other than this research.

Q1
Do you own a motorized sailboat, a personal watercraft such as a Jet-Ski or Waverunner or a power boat?
1. Yes
2. No (skpto TERM1)
8. Don't know/Refused (skpto TERM1)

Q2
Do you own more than one watercraft?
1. Yes
2. No (skpto Q5)
8. Don't know/Refused

Q3
What types of watercrafts do you own? Do you own… *(multiple choice, click all that apply)*
1. Powerboats
2. Motorized sail boats
3. Personal watercrafts
8. Don't know/Refused

Q4
Which of your watercrafts do you use the most?
1. Powerboat
2. Motorized sail boat
3. Personal watercraft
8. Don't know/Refused

Q5
Did you use your (primary) watercraft in the past year?
1. Yes
2. No
8. Don't know/Refused (IF answers = 2 skpto TERM1)

Q6
In which states did you use your <Insert Answer from Q4 here> in the past year?
(multiple choice, click all that apply)
1. Arkansas
2. Iowa
3. Kansas
4. Louisiana
5. Minnesota
6. Missouri
7. Nebraska
8. Oklahoma
9. Texas
10. Don't know/Refused

Q7

We would like to invite you to fill out a short paper survey regarding your boating activities with your watercraft you have used most in the past year, the <Insert Answer from Q5 here>. We would mail you the survey with a business reply envelope, and as a Thank-you gift you will also receive a Kwik Tex Safety whistle with floating Lanyard for your watercraft keys. May I have your address to send you the brief mail survey?
1. Yes
2. No, not interested (skpto TERM1)
3. Not sure (call back)

Q8

What is your mailing address?
Name:
Address:
City: / State: / Zip:

END1

Thank you very much for your participation in this important air quality study. You will receive the survey together with a business reply envelope and the boating key chain in the next 1-2 weeks in the mail. Please use the provided return envelope to send us back the filled out survey. You do not have to pay for postage. Do you have any other questions about this?

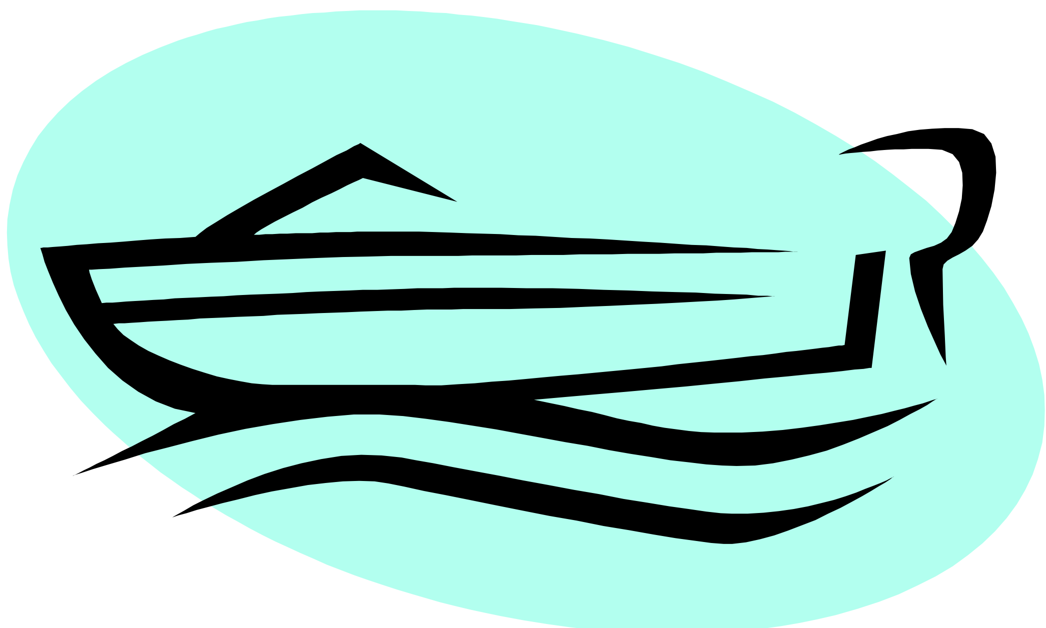
TERM1
Then these are all the questions I have for you. Thank you for your time. Good bye.

APPENDIX B

MAIL SURVEY INSTRUMENT

put sticker w/ boat type here
fscid

PLEASURE CRAFT SURVEY



1. **Check the one category, which best describes your registered boat.**

- ❑1 Sailboat with engine
- ❑2 Personal Water Craft (Jetski, Waverunner, etc.)
- ❑3 Power boat (bassboat, speedboat, houseboat, etc.)

2. **Which category below describes your primary propulsion engine?**

(*Do not describe any secondary propulsion used for low speed trolling and fishing.)*

- ❑1 Two-Stroke Gasoline Engine (requires gasoline and oil fuel mixture)
- ❑2 Four-Stroke Gasoline Engine (has an oil sump and dipstick)
- ❑3 Diesel (either 2 or 4 Stroke; requires diesel fuel)

3. **Which one of the following is the primary propulsion type for your boat?**
(Include auxiliary motors for sailboats, but do not include secondary motors for low speed trolling or fishing.)

- ❑1 Outboard
- ❑2 Inboard
- ❑3 Personal Water Craft Jet (Jetski engine, Waverunner engine, etc.)
- ❑4 Other (please specify): ____

4. **What is the horsepower for this boat's primary engine?**
(If unsure, you might want to check the specifications in the owner's manual. Otherwise, give your best estimate.)

_______________ hp

5. **What year was your engine manufactured?**
(If unsure, you might want to find the model year in the owner's manual.)

_______________A (enter year)

- ❑1 Not sure, but probably before 1997
- ❑2 Not sure, but probably 1997 or later
- ❑3 Don't know

6a. **Typically, how often do you use your boat during the following seasons?**
(Please choose the answer that best matches your boat usage.)

Winter (Dec - Feb):

- ❑1` Practically never
- ❑2 1 time per week or less
- ❑3 2-3 times per week
- ❑4 4-5 times per week
- ❑5 6 times per week
- ❑6 Practically every day

Spring (Mar – May):

- ❑7 Practically never
- ❑8 1 time per week or less
- ❑9 2-3 times per week
- ❑10 4-5 times per week
- ❑11 6 times per week
- ❑12 Practically every day

6b. **Summer (Jun - Aug):**

- ❑1` Practically never
- ❑2 1 time per week or less
- ❑3 2-3 times per week
- ❑4 4-5 times per week
- ❑5 6 times per week
- ❑6 Practically every day

Fall (Sep – Nov):

- ❑7 Practically never
- ❑8 1 time per week or less
- ❑9 2-3 times per week
- ❑10 4-5 times per week
- ❑11 6 times per week
- ❑12 Practically every day

7. **How often did you use your boat <u>during the past week</u>?**

- ❑1` Never
- ❑2 1 time
- ❑3 2 times
- ❑4 3 times
- ❑5 4 or more times

8a. **During each of the following seasons, what percentage of your boat trips occur on weekdays vs. weekends?**
(Please choose the answer that best matches your boat usage.)

Winter (Dec - Feb):

	Weekday	Weekend
❑ 1	0%	100%
❑ 2	25%	75%
❑ 3	50%	50%
❑ 4	75%	25%
❑ 5	100%	0%

Spring (Mar – May):

	Weekday	Weekend
❑ 6	0%	100%
❑ 7	25%	75%
❑ 8	50%	50%
❑ 9	75%	25%
❑ 10	100%	0%

8b. **Summer (Jun - Aug):**

	Weekday	Weekend
❑ 1	0%	100%
❑ 2	25%	75%
❑ 3	50%	50%
❑ 4	75%	25%
❑ 5	100%	0%

Fall (Sep – Nov):

	Weekday	Weekend
❑ 6	0%	100%
❑ 7	25%	75%
❑ 8	50%	50%
❑ 9	75%	25%
❑ 10	100%	0%

9a. **Typically, how many hours is the engine operating <u>per trip</u> when you use your boat during the following seasons?**
(Please choose the answer that best matches your boat usage.)

Winter (Dec - Feb):

- ❑ 1` More than 8 hours
- ❑ 2 6 – 8 hours
- ❑ 3 4 – 6 hours
- ❑ 4 2 – 4 hours
- ❑ 5 0 – 2 hours

Spring (Mar – May):

- ❑ 6 More than 8 hours
- ❑ 7 6 – 8 hours
- ❑ 8 4 – 6 hours
- ❑ 9 2 – 4 hours
- ❑ 10 0 – 2 hours

9b. **Summer (Jun - Aug):**

- ❑ 1` More than 8 hours
- ❑ 2 6 – 8 hours
- ❑ 3 4 – 6 hours
- ❑ 4 2 – 4 hours
- ❑ 5 0 – 2 hours

Fall (Sep – Nov):

- ❑ 6 More than 8 hours
- ❑ 7 6 – 8 hours
- ❑ 8 4 – 6 hours
- ❑ 9 2 – 4 hours
- ❑ 10 0 – 2 hours

10a. At what time do you typically launch your boat during the following seasons?

Winter (Dec - Feb):

- ❑ 1` Before 8:00 AM
- ❑ 2 8:00 AM – 11:00 AM
- ❑ 3 11:00 AM – 1:00 PM
- ❑ 4 1:00 PM – 4:00 PM
- ❑ 5 After 4:00 PM

Spring (Mar – May):

- ❑ 6` Before 8:00 AM
- ❑ 7 8:00 AM – 11:00 AM
- ❑ 8 11:00 AM – 1:00 PM
- ❑ 9 1:00 PM – 4:00 PM
- ❑ 10 After 4:00 PM

10b. Summer (Jun - Aug):

- ❑ 1` Before 8:00 AM
- ❑ 2 8:00 AM – 11:00 AM
- ❑ 3 11:00 AM – 1:00 PM
- ❑ 4 1:00 PM – 4:00 PM
- ❑ 5 After 4:00 PM

Fall (Sep – Nov):

- ❑ 6` Before 8:00 AM
- ❑ 7 8:00 AM – 11:00 AM
- ❑ 8 11:00 AM – 1:00 PM
- ❑ 9 1:00 PM – 4:00 PM
- ❑ 10 After 4:00 PM

11. When your boat engine is in operation, what percentage of time is typically spent at the following power settings? (Please circle an answer for each setting; answers should sum to 100%).

Example: 30
\+ 60
\+ 10 = **100%**

Near Idle/Low Throttle →	0	10	20	30	40	50	60	70	80	90	100 %	
Mid-throttle →	0	10	20	30	40	50	60	70	80	90	100 %	
Full throttle →		0	10	20	30	40	50	60	70	80	90	100 %
Total:				**100%** (of time when engine is in operation)								

12. Please estimate the amount of fuel you use in your boat each year.

Number of gallons purchased:

- ❑ 1` More than 300 gallons
- ❑ 2 200 – 300 gallons
- ❑ 3 100 – 200 gallons
- ❑ 4 50 – 100 gallons
- ❑ 5 Less than 50 gallons

13. In which counties do you typically operate your boat? (Use the county codes printed on the enclosed Waterways Map and choose up to three counties.)

County Code 1: ____________

County Code 2: ____________

County Code 3: ____________

Thank you for your cooperation.
Please use the provided business reply envelope to mail back the survey to

APPENDIX C

PERSONALIZED COVER LETTER

Population Research Systems

A Member of the FSC Group

May 2004

«fscid»:

Dear «q8»,

Thank you for agreeing to participate in the Central States Regional Air Planning Association (CENRAP) Pleasure Craft Study. CENRAP is an organization of states, tribes, federal agencies, and other interested parties that studies and addresses air pollution, regional haze and visibility issues. Through your participation, you will help CENRAP learn about factors that affect air quality in your state.

Please complete the enclosed questionnaire about your boat and your boating activities. We have provided a pre-paid business reply envelope to make it simple for you to send back the completed questionnaire. It should only take a few minutes of your time. In appreciation, we are including a safety whistle with floating lanyard for your watercraft keys.

The Central States Regional Air Planning Association has contracted with Population Research Systems (PRS), a research company, to collect this information. Please be assured that your responses and personal information will be kept confidential and will not be used for any purpose other than this study. PRS will combine your responses with hundreds of others and will report only group results, and only to the study sponsors.

If you have any questions about the study, please call Dr. Katrin Ewald of PRS, toll-free at (800) 777-0737. If you are interested in learning more about CENRAP, please visit their website at http://www.cenrap.org.

Thank you once again for participating in this important research.

Sincerely,

Katrin Ewald, Ph.D.
Director

APPENDIX C

SUMMARIES OF ACTIVITY DATA AND EMISSIONS MODELING INPUTS PREPARED FOR ON-ROAD EMISISON INVENTORIES:

VEHICLE-MILES OF TRAVEL,
FLEET DISTRIBUTIONS,
FUELS CHARACTERISTICS,
AND
REGULATORY CONTROLS

Pages C-3 through C-14 (12 pages) illustrate vehicle-miles of travel (VMT) compiled for each CENRAP state. One- to two-page data summary sheets were prepared for each state. Each data summary sheet includes the following elements of information. (The page position of each element is indicated relative to landscape orientation.)

<u>Element of Information (Page Position)</u>

- Sources of information—i.e., specific state agencies or "default", which indicates EPA guidance defaults (page header)
- CENRAP overview map identifying location of the state of interest (upper left)
- State overview map with interstate freeways (upper center)
- County-specific total annual VMT for 2002 (upper right)
- Distribution of total annual VMT by road type (lower left)
- Distribution of total annual VMT by vehicle type (lower center)
- Average speed by road type (most states: center right; Texas and Louisiana: lower right)
- Weekday diurnal pattern of VMT (most states: lower right; Texas, Louisiana, and St. Louis, Missouri, area: second page of data summary sheet for each state)

Box whisker plots were prepared as follows. The box centerline indicates the median, and the box extents represent the 25th and 75th percentiles with "outliers" plotted above the whiskers.

The whiskers have a maximum length equal to 1.5 times the length of the box (interquartile range). If there are data outside this range, the points are shown on the plot and the whisker ends on the highest or lowest data point within the range of the whisker. The outliers are further identified with asterisks representing the points that fall within 3 times the interquartile range from the end of the box and with squares representing points beyond this range.

Pages C-15 through C-18 (4 pages) illustrate the inputs that were compiled for MOBILE6 and NONROAD 2004 to describe fuel characteristics (such as sulfur content) for areas throughout the CENRAP.

Pages C-19 through C-21 (3 pages) illustrate the inputs that were compiled for MOBILE6 to describe regulatory programs (such as inspection and maintenance, or I/M) for areas throughout the CENRAP.

Pages C-22 through C-24 (3 pages) illustrate the inputs that were compiled for MOBILE6 to describe the IM 240 program of St. Louis, Missouri.

Pages C-25 through C-32 (8 pages) illustrate the MOBILE6 default age distribution of the vehicle fleet (for comparison purposes) and the weighted-average age distribution of the vehicle fleets for each of the CENRAP states. The weighted averages were calculated as the averages of county-level age distributions, weighted by the number of vehicles in each county. Thus, counties with more registered vehicles were weighted proportionally more heavily.

Pages C-33 through C-35 (3 pages) illustrate the fractions of the light-duty vehicle and light-duty truck fleets that are diesel-powered.

</table>

[a] If not specified, MOBILE6 assumes FUEL PROGRAM : 1, which corresponds to "Conventional Gasoline East": i.e., an average 2002 fuel sulfur content of 279 ppm and a maximum 2002 fuel sulfur content of 1000 ppm. For areas using Federal Reformulated Gasoline (RFG), the designation "S" or "N" is based upon the classification of regions in 40 CFR 80.71.

[b] Includes Franklin, Jefferson, St. Charles, and St. Louis Counties, and St. Louis City.

[c] All FUEL PROGRAM : 2 S areas should also use the SEASON command. SEASON : 1 applies May 1 through September 15; SEASON : 2 applies for the rest of the calendar year.

[d] Includes the following counties: Banner, Box Butte, Cheyenne, Dawes, Deuel, Garden, Keith, Kimball, Morrill, Scotts Bluff, Sheridan, and Sioux (40 CFR 80.215(a)(2)(i). Although this is the program recommended by EPA for these counties, use of this fuel program command in 2002 is optional, since the 2002 sulfur contents for FUEL PROGRAM : 3 are the same as those for FUEL PROGRAM : 1.

[e] Includes the following counties: Collin, Dallas, Denton, Tarrant.

[f] Includes the following counties: Brazoria, Chambers, Fort Bend, Galveston, Harris, Liberty, Montgomery, Waller.

Summary of MOBILE6 Inputs for Sulfur Contents of Diesel Fuels

State	DIESEL SULFUR command[a]
AR	DIESEL SULFUR : 360.0
IA	DIESEL SULFUR : 360.0
KS	DIESEL SULFUR : 330.0
LA	DIESEL SULFUR : 380.0
MN	DIESEL SULFUR : 360.0
MO	DIESEL SULFUR : 390.0
NE	DIESEL SULFUR : 360.0
OK	DIESEL SULFUR : 360.0
TX	DIESEL SULFUR : 364.0

[a] Value is sulfur content in units of parts per million by weight (ppmw); regulatory limit is 500 ppmw in 2002.

Summary of MOBILE6 Inputs for Oxygenated Fuels Specifications

State	Area	Period	Command	Ethers market share (fraction)	Alcohols market share (fraction)	Avg. wt. frac. Oxygen in Ether Blends	Avg. wt. frac. Oxygen in Alcohol Blends	RVP Waiver for Alcohol Blends

[a] Includes the following counties: Johnson (KS), Wyandotte (KS), Clay (MO), Jackson (MO), Platte (MO).
[b] Includes the following parishes: Ascension, East Baton Rouge, Iberville, Livingston, West Baton Rouge.
[c] Includes the following parishes: Jefferson, Orleans, St. Bernard, St. Charles.
[d] Includes Franklin, Jefferson, St. Charles, and St. Louis counties, and St. Louis City.
[e] Although the FUEL RVP command must be used, input data will be overridden by the FUEL PROGRAM : 2 S command during May 1 through September 15.
[f] Includes the following counties: Creek, Osage, Rogers, Tulsa, Wagoner.
[g] Includes the following counties: Jefferson, Hardin, Orange.
[h] Includes the following counties: Collin, Dallas, Denton, Tarrant.
[I] Includes the following counties: Brazoria, Chambers, Fort Bend, Galveston, Harris, Liberty, Montgomery, Waller.
[j] Includes the following counties: Anderson, Angelina, Aransas, Atascosa, Austin, Bastrop, Bee, Bell, Bexar, Bosque, Bowie, Brazos, Burleson, Caldwell, Calhoun, Camp, Cass, Cherokee, Colorado, Comal, Cooke, Coryell, De Witt, Delta, Ellis, Falls, Fannin, Fayeete, Franklin, Freestone, Goliad, Gonzales, Grayson, Gregg, Grimes, Guadalupe, Harrison, Hays, Henderson, Hill, Hood, Hopkins, Houston, Hunt, Jackson, Jasper, Johnson, Karnes, Kaufman, Lamar, Lavaca, Lee, Leon, Limestone, Live Oak, Madison, Marion, Matagorda, McLennan, Milam, Morris, Nacogdoches, Navarro, Newton, Nueces, Panola, Parker, Polk, Rains, Red River, Refugio, Robertson, Rockwall, Rusk, Sabine, San Jacinto, San Patricio, San Augustine, Shelby, Smith, Somervell, Titus, Travis, Trinity, Tyler, Upshur, VanZandt, Victoria, Walker, Washington, Wharton, Williamson, Wilson, Wise, Wood.

[a] TRC = Test and Repair program, computerized; T/O = Test Only program

[b] GC = gas cap check (evaporative emissions); IDLE = idling only test; 2500/IDLE = idling and 2500 rpm test; ASM 2525/5015 PHASE-IN = testing at 25 mph/25% load and 15 mph/50% load, phased-in cutpoints; OBD I/M = check of malfunction indicator lights; IM240 = transient 240-second test

[c] Default Waiver Rate is 5.0% for evaporative programs, except where an exhaust I/M program is also applicable, in which case the waiver rate for the evaporative program is the same as that for the exhaust program.

EXECUTIVE SUMMARY

The Central States Regional Air Planning Association (CENRAP) is researching visibility-related issues for its region and is developing a regional haze plan in response to the U.S. Environmental Protection Agency's (EPA) mandate to protect visibility in Class I areas. In support of the CENRAP's need to develop a regional haze plan, Sonoma Technology, Inc. (STI) developed a 2002 ammonia emission inventory for the region in keeping with the emissions estimation techniques presented in Appendix A—Ammonia Emission Estimation Methods for the CENRAP Ammonia Emission Inventory (Methods Document).

Consistent with the Methods Document, ammonia emissions were estimated for 13 source categories using the Carnegie Mellon University (CMU) model and supplemental technical work; 80% of technical work was dedicated to improving emissions estimates for two source categories—livestock production and fertilizer use. For these two categories, as well as biogenic sources, improvements were made to the activity data and/or emission factors used by the CMU model. For four other source categories (industrial point sources, landfills, ammonia refrigeration, and non-road mobile sources), emissions estimates were prepared independently of the CMU model, and for the remaining six source categories (publicly owned treatment works, wildfires, domestic animals, wild animals, human respiration, and on-road mobile sources), emissions estimates were derived by running the CMU model with no alterations.

In the resulting inventory, the most important source categories are estimated to be livestock and poultry, fertilizers, and biogenics. When combined, these three sources account for 87% of the annual ammonia emissions in the CENRAP region (see **Figure ES-1**). Seasonally, peaks in emission levels occur in spring and fall (especially during the months of April and October), times when manure and fertilizer are typically applied to croplands (see **Figure ES-2**).

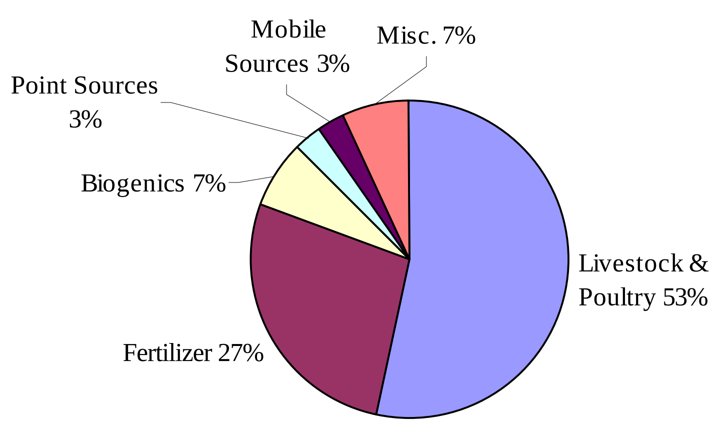

Figure ES-1. CENRAP 2002 ammonia emissions by source category.

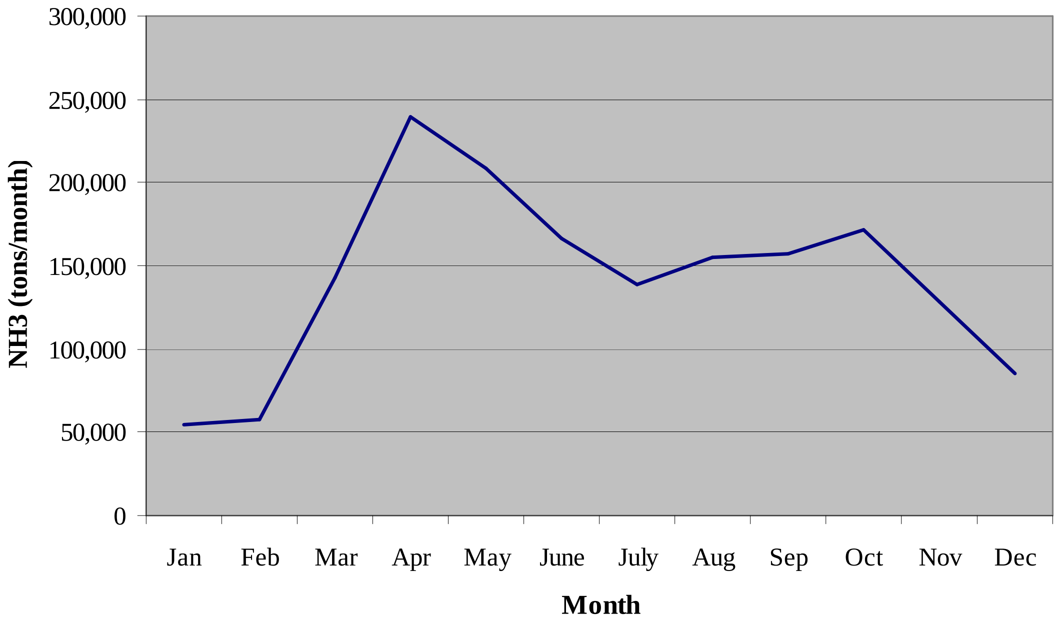

Figure ES-2. Monthly variability in total 2002 emissions for the CENRAP region.

As anticipated, emissions from livestock and poultry made the largest contribution to total estimated emissions for the CENRAP region and for each individual state (with the exception of Louisiana). This source category was especially significant in the states of Iowa and Oklahoma, where emissions from livestock and poultry accounted for over 60% of the total inventory (see **Table 2-1**). Fertilizer application was the second most significant source of ammonia emissions in the region, and this source category was especially important in Kansas and Nebraska, accounting for about 36% of the total inventory in those states. (Actual emissions estimates by source category and state are tabulated in Appendix B.)

The source with the greatest uncertainty in the inventory is biogenic emissions, because the emission rates and character of the natural environment as a source or a sink of ammonia are not studied as extensively as they are for other source categories. Significant uncertainties also exist in the available ammonia emission factors for agricultural activities, as they fail to adequately consider some important governing principles (such as climate, manure management, and animal diet). In addition, two source categories that may be significant at local geographic scales were necessarily omitted from the inventory due to lack of information: ammonia injection for NO_x controls and biosolids (or sewage sludges).

In order to improve the CENRAP's emission inventory in the future, we recommend research efforts, such as studies of activity data, which will allow the CENRAP to take advantage of next-generation emissions models that are currently under development for biogenics, livestock, and fertilizers. In addition, we recommend a survey of power plants in the CENRAP states to assess the emissions from ammonia-injection control technologies. Lastly, recognizing that a viable emissions model for sewage sludges may not be available for a long time, we recommend that an emissions inventory be developed for this source category through the initiation of emissions measurement programs and systems to gather or track pertinent activity data.

1. INTRODUCTION

The Central States Regional Air Planning Association (CENRAP) is researching visibility-related issues for its region, which includes the states of Texas, Oklahoma, Louisiana, Arkansas, Kansas, Missouri, Nebraska, Iowa, and Minnesota, and is developing a regional haze plan in response to the U.S. Environmental Protection Agency's (EPA) mandate to protect visibility in Class I areas. To develop an effective regional haze plan, the CENRAP must develop a conceptual model of the phenomena that lead to episodes of low visibility in the CENRAP region. It is widely recognized that the formation of secondary particulate matter—which is generated from chemical transformations in the atmosphere of gaseous precursor species such as ammonia, nitrogen oxides, sulfur oxides, and volatile organic compounds—contributes significantly to regional haze issues in the CENRAP region. Therefore, development of accurate and comprehensive emission inventories of these precursor species is important.

In support of the CENRAP's need to develop a regional haze plan, Sonoma Technology, Inc. (STI) responded to the CENRAP Work Assignment Number 02-0214-RP-003-001, "Research and Development of Ammonia Emission Inventories for the Central States Regional Air Planning Association." The project objectives were to identify and evaluate information resources that may be immediately applied to mitigate known weaknesses in the Carnegie Mellon University (CMU) model—an ammonia emissions modeling tool and database system that was developed by CMU and recently evaluated by STI—and to apply the findings to improve the CMU ammonia emission inventories for the CENRAP region. As directed by the CENRAP Emissions Work Group, STI dedicated at least 80% of its technical effort to improving emission estimates for two types of emissions sources—livestock production and fertilizer use—while the remainder of the work was directed toward improving emission estimates for other types of emissions sources (such as wastewater treatment plants, biogenics, or on- and off-road mobile sources).

1.1 BACKGROUND AND KEY ISSUES

1.1.1 Secondary Formation of Fine Particulate Matter in the CENRAP Region

Visibility impairment is primarily caused by particulate matter of aerodynamic diameter less than 2.5 microns ($PM_{2.5}$). $PM_{2.5}$ may be directly emitted from sources such as fugitive dust and combustion soot, which are termed sources of "primary $PM_{2.5}$". Condensable organic aerosols form from air emissions of semi-volatile and heavy organic compounds. In addition, $PM_{2.5}$ forms from photochemical reactions of gaseous precursors, including sulfur oxides (SO_x), nitrogen oxides (NO_x), volatile organic compounds (VOC), and ammonia (NH_3). This mechanism of $PM_{2.5}$ formation is termed "secondary formation".

The chemical composition of ambient $PM_{2.5}$ provides an understanding of the types of emissions sources that contribute to regional haze issues in different regions (see **Figure 1-1**). Ammonium sulfate, ammonium bisulfate, and ammonium nitrate are important secondary $PM_{2.5}$ constituents. In urban and ammonia-depleted areas of the eastern United States, sulfate is relatively a more significant contributor to $PM_{2.5}$ than it is in the western United States.

Conversely, nitrate is more important in urban and ammonia-rich areas of the western United States than it is in eastern areas. In both the eastern and western United States, the carbonaceous fraction of $PM_{2.5}$ is significant in urban areas. However, in more pristine areas, the contribution of geologic dust to ambient $PM_{2.5}$ becomes more important and may contribute up to 50% of observed $PM_{2.5}$ concentrations. Areas with abundant gaseous NH_3 experience rapid transformation of the atmospheric oxidation products of SO_x and NO_x emissions into fine aerosols of ammonium sulfate and ammonium nitrate.

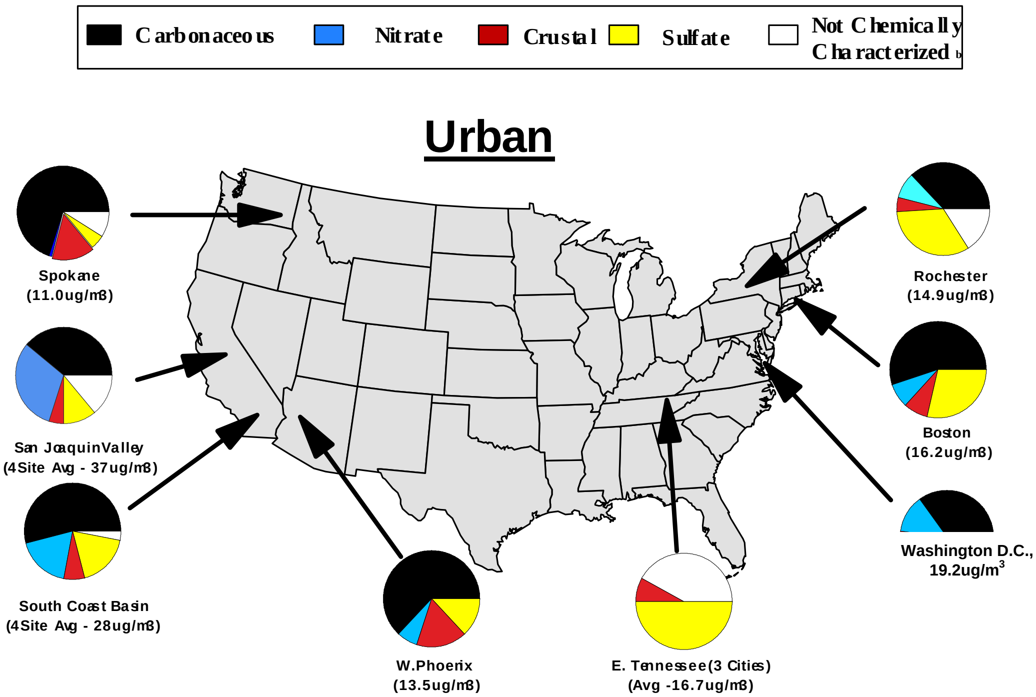

Figure 1-1. Compositions of annual average concentrations of $PM_{2.5}$ observations in urban locations (U.S. Environmental Protection Agency, 1998).

In order to develop a preliminary[1] understanding of the components that contribute to ambient levels of $PM_{2.5}$ in the CENRAP region, STI analyzed a data set of speciated $PM_{2.5}$ data for the region that was compiled by researchers at the Center for Air Pollution Impact and Trend Analysis at Washington University (Schichtel et al., 1999). The data were collected during various time periods and using various analytical sampling techniques; thus, the results should be considered uncertain until a more rigorous evaluation can be completed. Nevertheless, the data indicated several important characteristics. The preliminary data summaries shown in **Figures 1-2 and 1-3** indicate that at sites where sulfates and nitrates were measured, these secondary compounds together comprised approximately 30% to 60% of $PM_{2.5}$. In addition, sulfate concentrations are 2 to 10 times larger than nitrate concentrations. Furthermore, the

[1] It is recognized that more-recent monitoring data have become available since this preliminary analysis was done. While the data sources cited provide the level of understanding needed for this background discussion, it is recommended that future efforts include analysis of the most recent monitoring data.

highest ratios of sulfates to nitrates and the highest average concentrations of $PM_{2.5}$ were observed in the southeastern portions of the CENRAP region. This is consistent with observations presented by Falke (1999) shown in **Figure 1-4**. However, it is important to note that Falke's analyses also indicated relatively high levels of uncertainty in the western portion of the CENRAP region (**Figure 1-5**). Other potential uncertainties in the monitoring data also can affect analyses of $PM_{2.5}$ data. For example, Malm et al. (2000) reported differences as large as a factor of two between IMPROVE and CastNet (CDN) observations at Big Bend National Park, Texas, (the only CENRAP Class I site studied) (see **Figure 1-6**). Examination of estimated SO_2 emission rates and population densities across the United States (**Figures 1-7 and 1-8**) helps explain why $PM_{2.5}$ concentrations are somewhat higher and sulfates are so important in the southeast portion of the CENRAP region.

1.1.2 Prior Statuses of Ammonia Emission Inventories

As a whole, few areas of the CENRAP region historically have experienced significant air quality problems and, therefore, monitoring and emissions estimates were relatively scarce. The most comprehensive sources of emissions estimates were the EPA's National Emissions Inventory (NEI), which is used as the basis of the EPA's National Emission Trends (NET) document series and analyses, and the CMU ammonia modeling tool and database system. Through previous studies, STI identified the following weaknesses and areas needing improvement in the NEI and CMU databases.

- Potentially important anthropogenic sources of ammonia include agricultural sources (animal husbandry and fertilizer application), mobile sources, natural (or "biogenic") sources, ammonia injection for NO_x control at power plants, and wastewater treatment plants. In many cases, the associated emission factors, activity parameters, seasonal profiles, and spatial patterns are highly uncertain and in need of improvement. The CMU model provides a framework for the development of county-level ammonia inventories, but it required significant improvements in its emission factors and activity data in order to represent the most up-to-date and geographically specific information possible.
- The NEI is estimated on an annual average basis. As Figure 1-4 illustrates, regional haze has a seasonal character and is partly driven by photochemical processes. Adjustments were necessary to develop seasonal, diurnal, and, possibly, day-of-week emission estimates.

- For mobile sources, improved activity inputs would be helpful, such as region-specific or state-specific fleet characteristics and improved vehicle miles traveled (VMT) estimates for rural areas. (Note that this improvement will be completed through a separate work assignment with the CENRAP.)
- For smaller point sources, STI found that the NET inventory can be highly inaccurate. For example, in the region surrounding Memphis, Tennessee, STI found that the 1996 NET inventory underestimated emissions of VOCs and NO_x by factors of 10 or more.
- To support modeling sensitivity runs, measures of uncertainty for all emission estimates are highly valuable for policy decisions and prioritization of future research efforts. Because the CENRAP ammonia inventory was compiled entirely from pre-existing emission factors and data, which lacked associated quantitative uncertainties, we are limited to providing only qualitative assessments of the emissions estimates. These are discussed in the Executive Summary and in Section 3, Recommendations for Further Research.

1.1.3 Project Priorities

To meet the CENRAP's primary goals, STI balanced the immediate need for a practical and cost-effective ammonia emission inventory with the need to incorporate the latest research and best available information. Thus, STI dedicated the majority of its resources to areas that the CENRAP has indicated are the highest priority: emissions from livestock management and fertilizer application. In addition, STI provided technology transfer services and documentation so that the work products of this project may be easily modified or applied by third parties, such as the CENRAP's Modeling Work Group or the CENRAP States' emissions and air quality specialists.

1.2 CURRENT STATUS OF THE CENRAP EMISSION INVENTORY

The resultant emission inventory produced through this work assignment is illustrated in **Figures 1-9, and 1-10** and tabulated in Appendix B. In all cases, we have applied generally accepted emission factors and the most complete and up-to-date activity data sets that could be identified and acquired. However, we also understand that available ammonia emission factors are uncertain, that they fail to adequately consider some important governing principles (such as climate, manure management, and animal diet), and that they continue to be the subject of research. These considerations are especially important for those areas of the inventory that we qualitatively consider to contribute the greatest degrees of uncertainty to the total estimated emissions: biogenic emissions (often called "natural soils"), livestock emissions, and fertilizer emissions. To help mitigate the effects of these uncertainties in the future, we have provided the CENRAP with an inventory and system of data files that can be updated with revised emission factors and activity data as new information become available (see Appendix D).

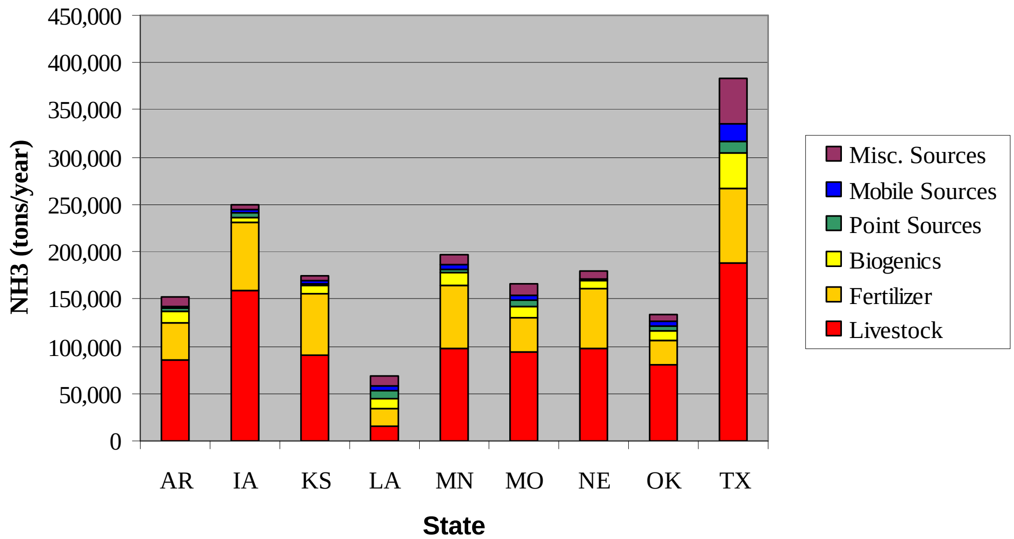

Figure 1-9. Total annual ammonia emissions by source category for each state of the CENRAP region.

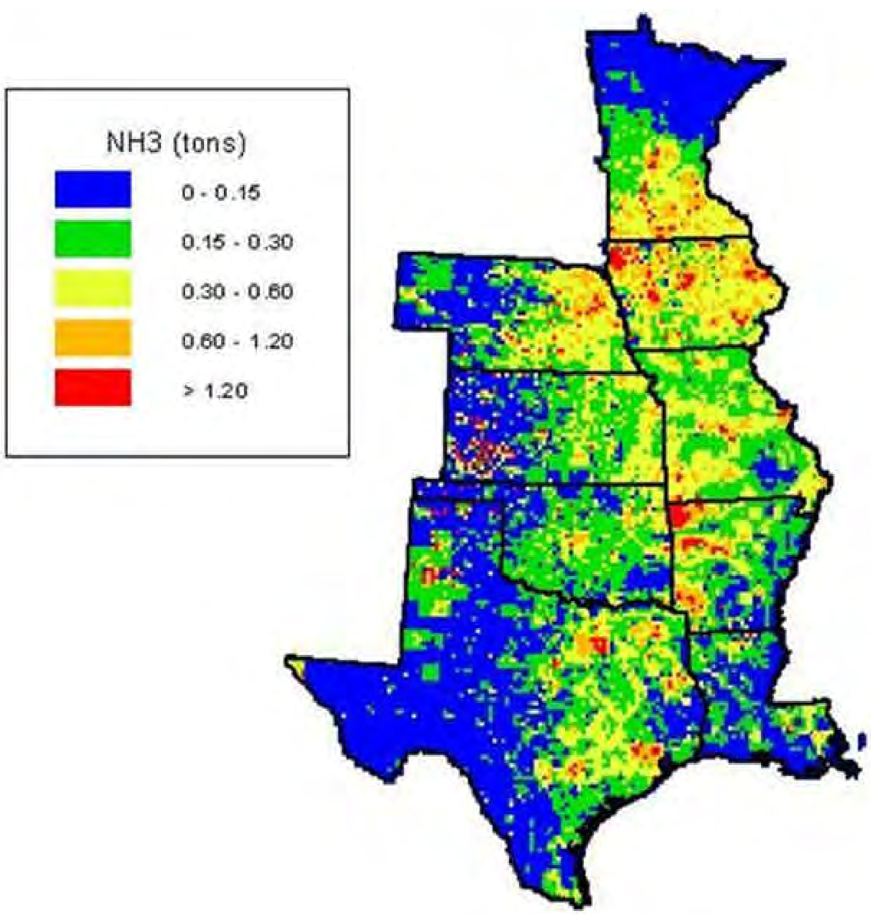

Figure 1-10. Geographic map of emissions densities for the CENRAP region, July 10, 2002.

2. SUMMARY AND ASSESSMENT OF THE INVENTORY

STI calculated emissions as detailed in Appendix A—Ammonia Emission Estimation Methods for the CENRAP Ammonia Emission Inventory. (Results are tabulated in Appendix B—Tabulation of Ammonia Emissions Estimates for the CENRAP Region.) In addition, STI carried out quality assurance procedures as provided in the Quality Assurance Plan and as detailed in this section. In summary, the most important source categories are estimated to be livestock and poultry, fertilizers, and biogenics, all three of which are also considered to contribute the greatest sources of uncertainty in the overall inventory. Total emissions vary seasonally by a factor of 3 to 8, with peaks occurring in the spring or fall. Total emissions vary geographically across the CENRAP region from <0.0.003 to >2 metric tons per day per square kilometer.

2.1 EMISSIONS FROM LIVESTOCK AND POULTRY

2.1.1 Summary of Emissions from Livestock and Poultry

Emissions estimates were generated for several types of livestock and poultry, including beef cattle, milk cows, hogs/pigs, sheep, goats, horses, broilers, layers, pullets, turkeys, geese, and ducks. The population of each of these animal types housed in concentrated animal feeding operations (CAFOs) was determined so that emissions from these facilities could be treated as point sources, with emissions from the remaining "free range" animals being treated as area sources. It was determined that emissions from livestock and poultry contribute 53% to total estimated emissions for the CENRAP region, ranging from 23% to 63% of total emissions from state to state (see **Table 2-1**). Emissions associated with concentrated animal feeding operations (CAFOs) were especially high for Iowa and Kansas, exceeding emissions associated with "free range" livestock for those two states. **Figure 2-1** shows the relative importance of each animal type in each state. The most important animal types are beef cattle (especially in the states of Texas, Kansas, and Nebraska), hogs and pigs (especially in the states of Iowa and Minnesota), and poultry (especially in the state of Arkansas).

The seasonal variability of livestock emissions follows a bimodal pattern, with peaks in spring and fall when manure is typically applied on croplands as fertilizer. **Figure 2-2** illustrates the seasonal variability in livestock emissions for each state.

Table 2-1. Livestock and poultry emissions by state.

	NH_3 Emissions (tons/year)			% of State
State	CAFOs[1]	Free range[2]	Total	Inventory
Arkansas	4,096.0	81,978.6	86,074.6	56.5%
Iowa	88,722.5	69,713.6	158,436.1	63.3%
Kansas	57,611.1	33,455.9	91,067.0	52.1%
Louisiana	82.4	15,837.5	15,919.9	23.1%
Minnesota	25,518.0	72,562.1	98,080.1	49.8%
Missouri	24,685.5	68,925.6	93,611.1	56.6%
Nebraska	30,240.0	66,743.0	96,983.0	53.9%
Oklahoma	19,864.6	60,016.8	79,881.4	60.1%
Texas	45,650.0	143,115.0	188,765.0	49.2%

[1]Includes emissions from all animal types housed at CAFOs in each state.
[2]Includes emissions from all non-CAFO animals in each state.

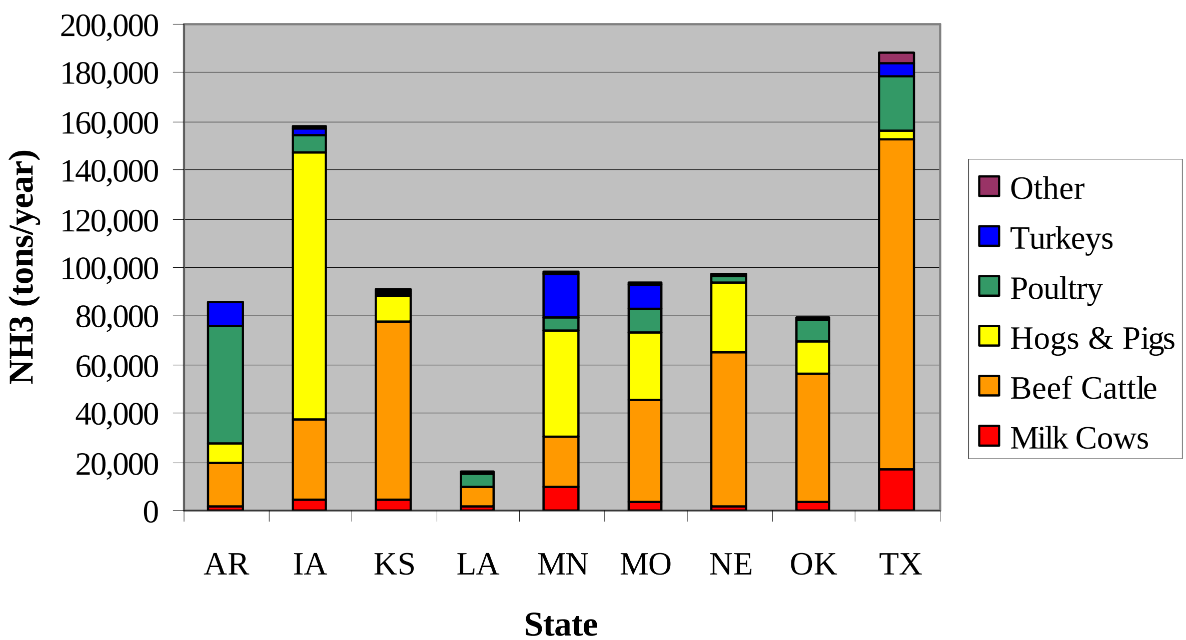

Figure 2-1. Livestock and poultry emissions by state and animal type.

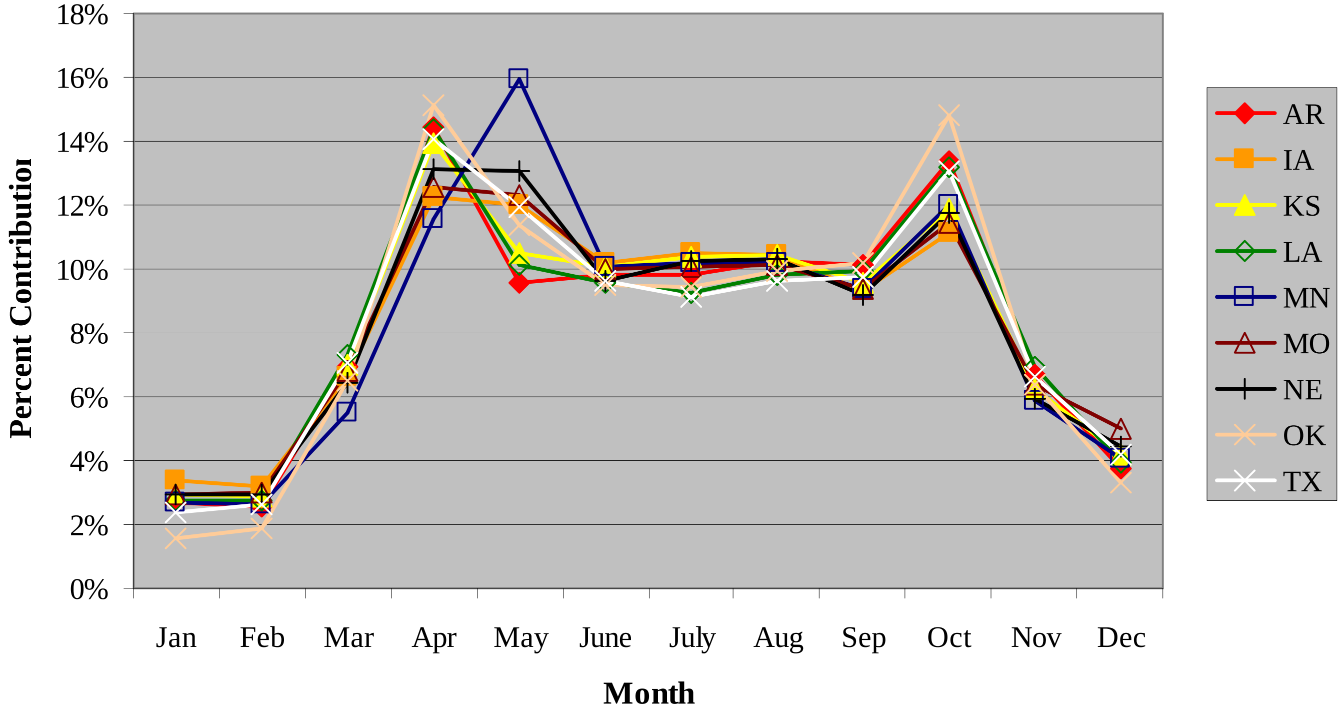

Figure 2-2. Seasonal variabilities in emissions from livestock and poultry by state.

2.1.2 Assessment of Emissions from Livestock and Poultry

This category (livestock and poultry) was the largest source of ammonia emissions in the inventory, which is to be expected for large Midwestern states recognized for their livestock production. (Louisiana is an exception.) To check the reasonableness of the emissions presented above, state totals were compared with results obtained by running the CMU model with no alteration in livestock population estimates (see **Figure 2-3** and Appendix C). Each state's total was within 5% of the CMU result with the exception of Kansas, where our emissions estimate was 14% higher. This difference is due to the fact that we estimate a greater population of beef cattle in Kansas based on National Agricultural Statistics Service (NASS) and CAFO data than is reported in the 1997 Census of Agriculture.

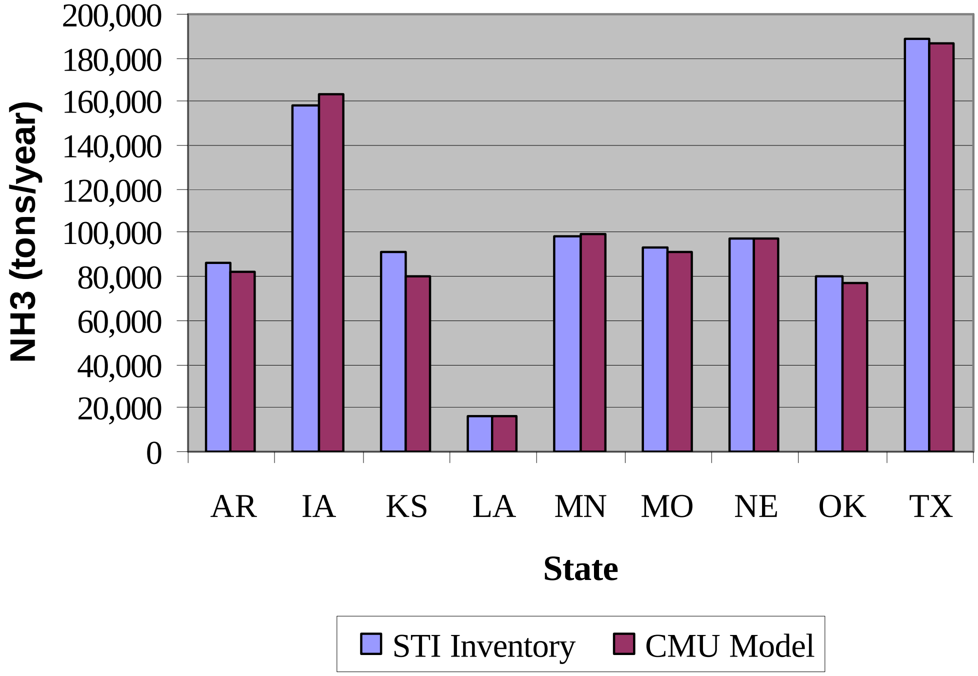

Figure 2-3. Comparison of livestock emission totals.

A second quality assurance step taken was the production of an emissions density plot showing only the point source portion of the inventory, which largely consists of CAFOs (14,000 point sources were included in the inventory, of which 80% were CAFOs). **Figure 2-4** shows a band of sources across northern Texas, western Kansas, central Nebraska, all of Iowa, and southern Minnesota, a distribution that can also be seen in an animal population density map for confined livestock produced by the U.S. Department of Agriculture for 1997 (see **Figure 2-5)**.

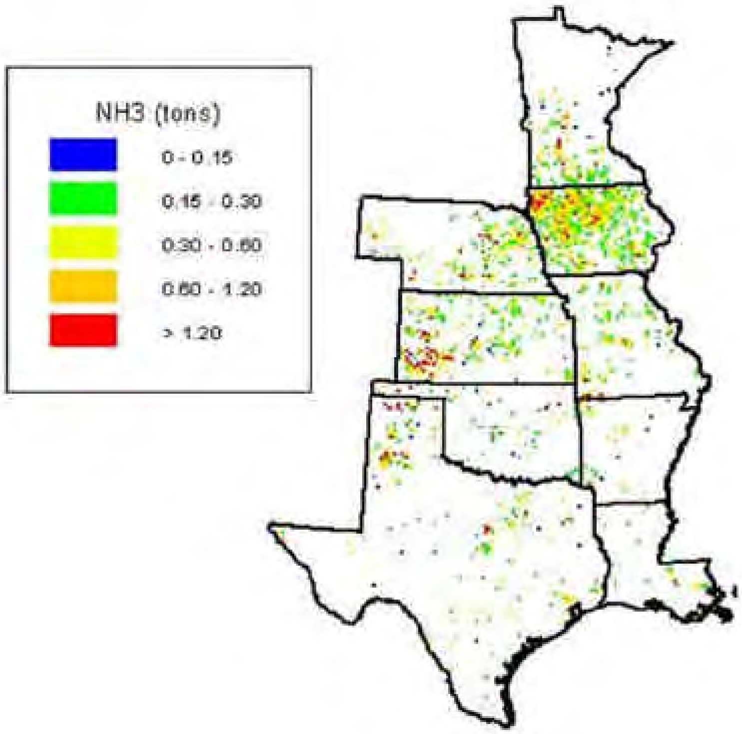

Figure 2-4. Point source emissions for July 10, 2002.

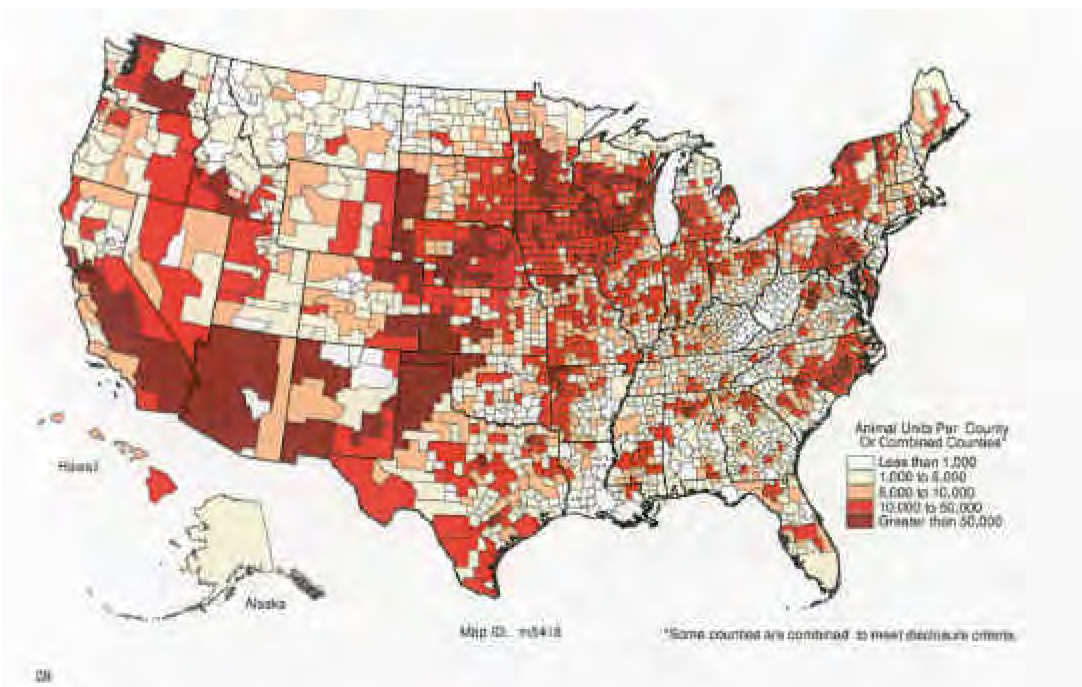

Figure 2-5. Animal population density map for confined livestock, 1997 (Kellogg et al., 2000).

2.2 EMISSIONS FROM FERTILIZER APPLICATION

2.2.1 Summary of Emissions from Fertilizer Application

Emissions from fertilizer application contribute 27% to total estimated emissions for the CENRAP region, ranging from 20% to 37% of total emissions from state to state. The most important fertilizer types are urea (especially in the states of Minnesota, Texas, and Arkansas), nitrogen solutions (especially in the states of Texas, Nebraska, and Iowa), and anhydrous ammonia (especially in the states of Iowa, Nebraska, and Kansas). **Figure 2-6** illustrates the relative importance of each fertilizer type in each state.

Similar to emissions from livestock and poultry, emissions from fertilizer application follow a bimodal pattern of seasonal variability, with peaks in the spring and fall (see **Figure 2-7**). Some states exhibit particularly pronounced emission spikes in certain months due to the types of crops that dominate in the state. Iowa, for example, is dominated by corn growers and does not produce as wide a variety of crops as other CENRAP states. Thus, in Iowa 40% of all emissions from fertilizer application occur in the month of April. Oklahoma and Kansas, on the other hand, produce a great deal of winter wheat and, therefore, have unusually high emission rates in August and September.

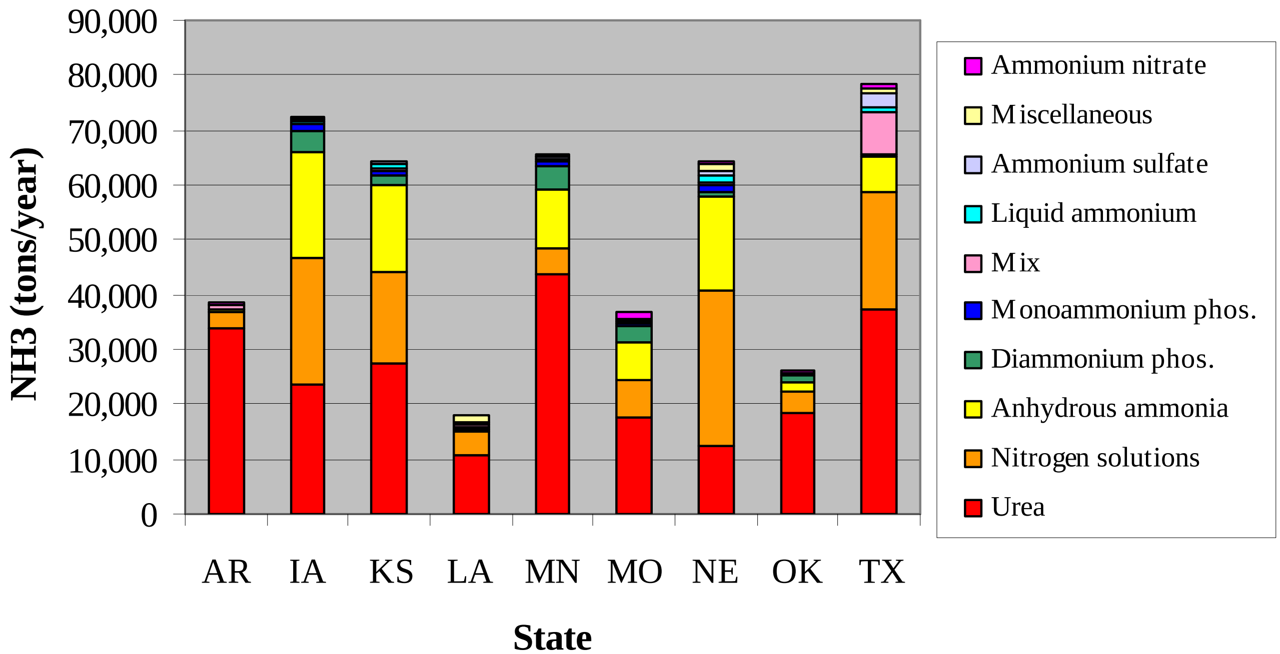

Figure 2-6. Emissions by fertilizer type for each state of the CENRAP region.

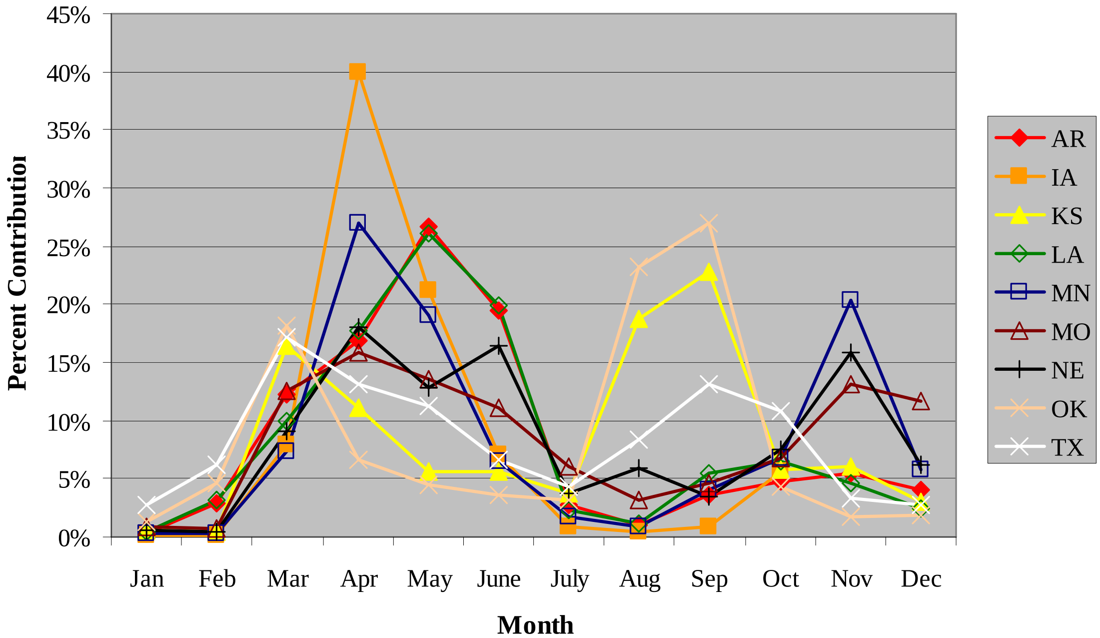

Figure 2-7. Seasonal variabilities in emissions from fertilizer application for each state of the CENRAP region.

2.2.2 Assessment of Emissions from Fertilizer Application

As expected, this category was the second largest source of ammonia emissions in the inventory. To check the reasonableness of the emissions presented above, state totals were again compared with results obtained by running the CMU model with no alteration in fertilizer activity data or emission factors (see **Figure 2-8** and Appendix C). The emissions totals for five states were within 5% of the CMU result, while the emissions for three states (Nebraska, Missouri and Louisiana) were 10% - 27% higher than the totals produced by the CMU model. Only one state, Kansas, proved to have significantly lower emissions (-8%) than those predicted by the CMU model.

These differences are largely due to changes in activity data and emission factors. First, we replaced the 1995 Association of American Plant Food Control Officials (AAPFCO) fertilizer usage data used in the CMU model with 2002 AAPFCO data, resulting in significant changes in activity data for some states. For example, total fertilizer usage in Kansas dropped 25% from 1995 to 2002, resulting in a significant emission reduction. On the other hand, fertilizer usage in Nebraska increased by 15% over the same time period, resulting in a 27% increase in emissions.

Additionally, we updated the emission factors used by the model. These emission factors were developed by the European Environment Agency (2001) and are dependent on soil type and climate. The European factors can be grouped according to the following classification system:

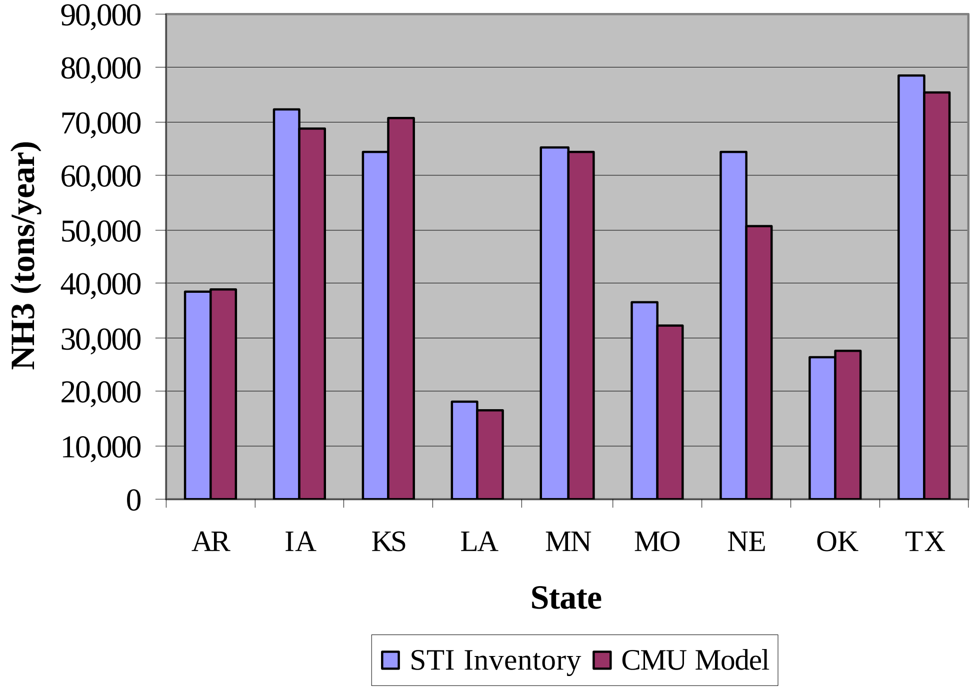

Figure 2-8. Comparison of emission totals from fertilizer application.

- Group I – Warm, temperate areas with a large proportion of calcareous soils.
- Group II – Temperate and warm-temperate areas with some calcareous soils (or managed with soil pH>7), but with large areas of acidic soils.
- Group III – Temperate and cool-temperate areas with largely acidic soils.

While the CMU model assigns whole states to one of the groupings listed above, we made these assignments at the county level based on the average soil pH in a given county (as reported by the National Resources Conservation Service (1994). Thus, for example, while the CMU model assigns all Nebraska counties to Group III, we assigned the majority of the state's counties to Group II, a classification with higher emission factors than Group III.

2.3 BIOGENIC EMISSIONS

2.3.1 Summary of Biogenic Emissions

Biogenic emissions (often called "natural soil" emissions) are especially uncertain because emission rates and the character of the natural environment as a source or a sink of ammonia are not studied as extensively as they are for other source categories. We estimated that biogenic emissions contribute 7% to total estimated emissions for the CENRAP region, ranging from 2% to 15% of total emissions from state to state. The most important land cover

types are croplands and pasture (especially in the states of Texas, Iowa, and Kansas), deciduous forests (especially in the states of Missouri, Oklahoma, and Texas), and mixed forests (especially in the states of Texas, Minnesota, and Arkansas). **Figure 2-9** illustrates the relative importance of each land cover type in each state. No information about seasonal variabilities was available; therefore, no monthly temporal profiles have been assigned.

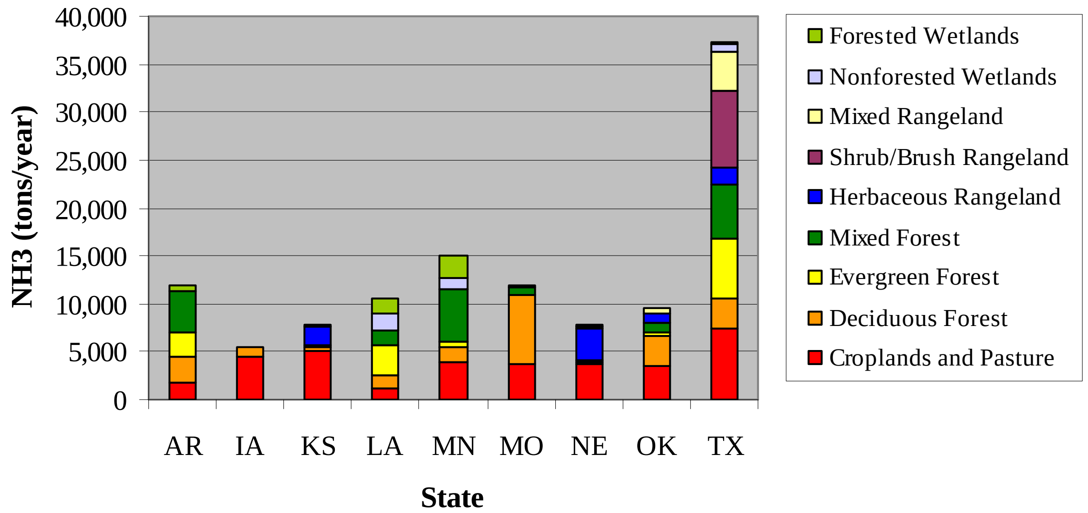

Figure 2-9. Biogenic emissions by land cover type for each state of the CENRAP region.

2.3.2 Assessment of Biogenic Emissions

Emissions estimates for this source category are *highly uncertain*. Initial estimates calculated using the CMU model's activity data and emission factors resulted in biogenic emission totals that accounted for half the total ammonia inventory in the CENRAP region. After a literature search, we chose to apply emission factors that were selected for use by Battye et al. (2003), which were based on factors reviewed or published by Schlesinger and Hartley (1992), Buowman et al. (1997), Kinnee et al (1997), and Van Der Hoek (1998). Use of these emission factors reduced biogenic emissions by 93% overall (see **Figure 2-10**), with the result that biogenic emissions accounted for 7% of the total CENRAP ammonia inventory. Battye et al. (2003) calculated similar percent contributions—about 6.6% and 6.3%—for emission inventories in North Carolina and California's San Joaquin Valley. When the CENRAP inventory is used for modeling sensitivity runs, it will be important to consider a wide range of uncertainty in the estimates of biogenic emissions.

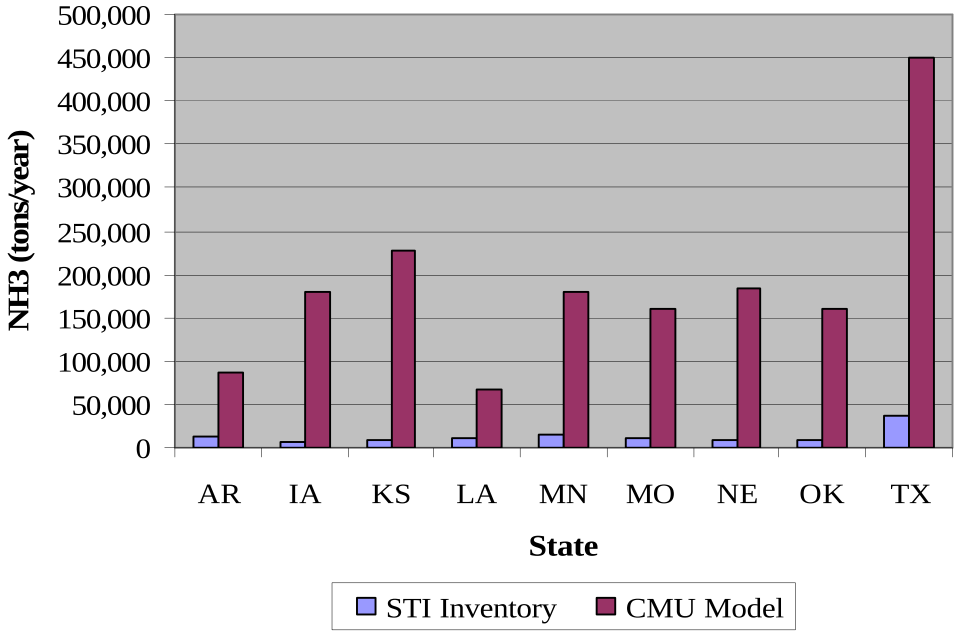

Figure 2-10. Comparison of biogenic emission totals.

2.4 EMISSIONS FROM OTHER SOURCE CATEGORIES

2.4.1 Summary of Emissions from Other Source Categories

All other source categories contributed 13% to total estimated emissions for the CENRAP region, ranging from 5% to 35% of total emissions from state to state. These included publicly owned treatment works (POTWs), wildfires, on-road mobile sources, non-road mobile sources, industrial point sources, landfills, ammonia refrigeration, and miscellaneous sources (domestic animals, human respiration, and wild animals). The most important of these source types are wild animals (especially in the states of Texas, Louisiana, and Arkansas), domestic animals (especially in the states of Texas, Missouri, and Oklahoma), and on-road mobile sources (especially in the states of Texas, Minnesota, and Missouri).

2.4.2 Assessment of Emissions from Other Source Categories

Because these source categories were relatively unimportant in comparison with livestock and fertilizer application, simple methods were employed to estimate the ammonia emissions associated with them. Emissions from six of these source categories (POTWs, wildfires, on-road mobile sources, domestic animals, wild animals, and human respiration) were taken directly from the CMU model with no updated activity data or emission factors.

Three other source categories (non-road mobile sources, landfills, and ammonia refrigeration) were omitted from the CMU model, so we independently prepared emissions estimates for these categories. Emissions from non-road mobile sources were taken directly

from the 1999 NEI, emissions from landfills were calculated from facility-specific, waste-in-place estimates, and emissions from ammonia refrigeration were estimated on an employment-based emission factor of 187 kg NH_3/employee reported by Battye et al. (1994). As the latter estimate is the most uncertain, we verified the scale of the emission factor by determining that annual production of ammonia for refrigeration uses in the United States is between 270,000 Mg and 350,000 Mg (Battye et al., 1994; International Institute of Ammonia Refrigeration, 2003). For the food-production industries that commonly use ammonia refrigeration, total United States employment equals approximately 1 million employees (U.S. Census Bureau, 2003). Thus, these figures yield a factor of 270 to 350 kg NH_3/employee-yr, which is on the same order of magnitude as the factor estimated by Battye et al. (1994), although it is 44% to 87% larger.

Finally, for industrial point sources, county-level emissions data from the EPA's 1995 Toxics Release Inventory (TRI), which was loaded into the CMU model, were replaced with data from the 2001 TRI and 1999 NEI point source inventory. Emissions reported in the more recent TRI data were selected for facilities with emissions records in both data sets, and emissions for several "supersized" ammonia sources (those with emissions greater than 5 tons/summer day) in the 1999 NEI were altered or eliminated based on guidance received from individual states (Sabo, 2003).

2.5 SOURCE CATEGORIES OMITTED FROM THE INVENTORY

We considered, but omitted, several source categories from the final inventory, including biomass burning, composting, geothermal emissions, ammonia injection for NO_x control, and biosolids (sewage sludges). These categories were excluded for the following reasons:

- *Biomass Burning.* The CMU model estimates ammonia emissions from wildfires, but not planned burning. However, because a planned burning emissions inventory, which will include ammonia, is being developed by STI under a different work assignment, this source category will be addressed through that separate project.
- *Composting*. Ammonia is released during the degradation of organic waste at composting operations. A 2000 inventory of ammonia emissions prepared by AVES for California's South Coast Air Basin (Botsford et al., 1999) utilized an emission factor of 2.755 pounds of ammonia per ton of material processed to estimate emissions from this source. In that inventory, composting operations accounted for 5.25% of the total inventory. However, this estimate was based on an annual throughput of 2,445,600 tons of waste in the South Coast Air Basin alone. By comparison, the only CENRAP states for which composting activity data were readily available—Iowa and Minnesota—report statewide annual throughputs of only 628,000 tons and 462,000 tons, respectively. Based on this indication that composting efforts are not likely to be widespread in the CENRAP region and a lack of easily accessible data for the seven other states, we excluded this source category.
- *Geothermal Emissions.* Geothermal power-generation facilities release significant ammonia emissions from cooling towers. However, the *Renewable Energy Annual 1996* (Energy Information Administration, 1997) indicates that "known geothermal resource

areas in the United States with resource conditions sufficient to generate electricity are rare, occurring domestically only in the Western United States and Hawaii."

- *Ammonia Injection for NO_x Control.* One technology for controlling NO_x emissions from stack gases is the injection of ammonia into the exhaust of boilers or gas turbines—an approach that is primarily used at power generation facilities. Excess ammonia that does not react with NO_x is emitted to the atmosphere and is referred to as "ammonia slip."

  In an attempt to determine whether any facilities in the CENRAP states use this technology, we searched control codes contained in the 1999 NEI database. No facilities reported the use of ammonia injection in the NEI. A telephone survey of power generation facilities would be necessary to confirm the absence of these controls. However, such a survey was beyond the scope of the current project; therefore, this source category was omitted.

- *Biosolids.* Our recent review of the CMU Ammonia Model identified biosolids (or sewage sludges) as a source of potentially significant emissions on local scales, but also a source for which emission factors and activity data were insufficient to generate an emission inventory (Chinkin et al., 2003). The effort required to develop the necessary information through measurement programs and facility surveys is beyond the scope of the current project; therefore, this source category was omitted.

3. RECOMMENDATIONS FOR FURTHER RESEARCH

In this report, we have identified the following significant sources of uncertainty (roughly in order of importance): emission factors and temporal profiles for biogenic emissions, livestock emissions, and fertilizer emissions. Research is currently progressing into improved emissions models in each of these three areas. In general, we recommend keeping current with the latest published findings as they are released; from these, identifying the governing parameters that influence emission rates; and setting goals and planning research efforts to gather and track the activity data that will be needed as inputs for the next generations of emissions models. In addition, we have identified two source categories that lack sufficient information to generate emissions estimates for the CENRAP region: ammonia injection for NO_x control and biosolids.

3.1 RECOMMENDATIONS FOR BIOGENIC SOURCES

The largest degree of uncertainty in total emissions is associated with the biogenic source category. Depending on the choice of currently available emission factors, biogenics may be estimated to contribute more than 50% of total annual emissions in the CENRAP region (10 to 15 times more than we estimated), or plant-soil systems may be considered to behave as a net sink of ambient ammonia. In addition, ammonia fluxes for plant-soil systems have been shown to change direction—from net source to net sink—at different times of the year and at different times of the day (Sutton et al., 2002). However, we were unable to identify information that would readily translate into seasonal or diurnal temporal profiles.

Additionally, a lack of clarity currently exists regarding assignment of ammonia emissions to the biogenics category versus the livestock or fertilizer categories. Application of fertilizers or manures to grasslands and cutting of grass have been shown to greatly increase the release of ammonia from living plants (Sutton et al., 2002). However, an argument can be made that because the excess emissions are driven by anthropogenic processes, they are more appropriately assigned to an anthropogenic source category (such as fertilizer use, livestock, or land management).

At this time, the best prospect for improving biogenic emissions estimates for the CENRAP region is the application of research findings from recent and ongoing projects that focus on measurements and modeling of ammonia fluxes from European grasslands: the GRassland-AMmonia INteractions Across Europe (GRAMINAE) and the Emissions and Deposition programs, which have been conducted in partnership with the Coordinated Ammonia Research Activities (CARA) program of the Centre for Ecology and Hydrology (CEH), Edinburgh Research Station, United Kingdom. (Information about CARA, GRAMINAE, and the Emissions and Deposition research programs may be found at http://www.nbu.ac.uk/cara/nh3home.htm.) Recent publications have presented models of ammonia exchange with grassland ecosystems (Flechard et al., 1999; Nemitz et al., 2001; Spindler et al., 2001). In order to apply these models and generate improved estimates of biogenic emissions for the CENRAP region, research should be undertaken to validate their applicability to the CENRAP region, to acquire activity data that the models use as inputs (such as land use information, climatological data, and levels of agricultural nitrogen inputs), and to

modify the models for application to the CENRAP region. Such a research effort would be significant in scope; however, the payoff is likely to be worth the expense.

3.2 RECOMMENDATIONS FOR LIVESTOCK

3.2.1 Address Next-Generation Emissions Models

The degree of uncertainty in livestock emissions is also large. Battye et al. (2003), who applied methods similar to ours, recently estimated uncertainties of roughly ±35% for annual emission inventories that were prepared for regions of North Carolina and California. Emission factors and models for livestock and poultry are an area of active research. Researchers are developing emission factors and models that take into account weather and soil conditions, manure management practices, animal diets, and animal housing configurations. Recent peer-reviewed publications include Huijsmans et al. (2003), Battye et al. (2003), Mathur and Dennis (2003), Gilliland et al. (2003), and Riedo et al. (2002). Journals in which research is often published include *Environmental Pollution*; *Atmospheric Environment*; *Water, Air, and Soil Pollution*; *Journal of Agricultural Engineering Research*; *Nutrient Cycling in Agroecosystems*; *Agriculture, Ecosystems and Environment*; and *Plant and Soil*.

In order to take advantage of the research results that have been recently published and will be published over the next few years, productive research efforts could be directed toward the study and acquisition of the activity parameters that are likely to be needed for the emission models under development, such as thorough surveys of manure management practices, manure disposal methods, land application methods, and typical weather conditions experienced at various stages of the manure handling cycle.

3.2.2 Refine Animal Population Estimates

Though the 1997 Census of Agriculture livestock population data used by the CMU model was updated with more current NASS data and state-provided CAFO population data, some uncertainties still exist, particularly in reference to the CAFO data. During this process of updating livestock populations, it was noticed that for several counties the CAFO-reported animal populations greatly exceeded the county totals found in the NASS and/or Census data. For example, the 1997 Census of Agriculture reports 8.3 million broilers (a type of poultry) in Barry County, Missouri, whereas the CAFO data received from the Missouri Department of Natural Resources shows 12 million broilers in the county.

Investigation revealed that for CAFO permitting purposes, facilities report maximum capacities rather than actual animal populations. While it can be assumed that most CAFOs attempt to operate near their capacity, there are situations where this does not appear to be the case, or where facilities are reporting an annual throughput rather than a one-time population figure (we discovered the latter to be the case with a large livestock auction yard in Canadian County, Oklahoma, for example). Because of such anomalies, CAFO data for some counties were scaled down to ensure that total animal population counts remained comparable with data reported in NASS estimates and the 1997 Agricultural Census. For future efforts, uncertainties

could be reduced by conducting a survey of large CAFOs in selected counties to determine how closely they operate to their reported maximum capacities.

3.3 RECOMMENDATIONS FOR FERTILIZERS

Uncertainties in the emissions estimates for fertilizers carry similar significance for the CENRAP inventory as the uncertainties for livestock emissions—roughly 20% or so of the total inventory. As is the case for livestock, emission factors and models for fertilizers are an area of active research. Researchers are developing emissions models that take into account weather and soil conditions, land application methods, and fertilizer quality. Research is frequently published in the same journals listed for livestock: *Environmental Pollution*; *Atmospheric Environment*; *Water, Air, and Soil Pollution*; *Journal of Agricultural Engineering Research*; *Nutrient Cycling in Agroecosystems*; *Agriculture, Ecosystems and Environment*; and *Plant and Soil*. In order to apply the next-generation models that are likely to become available over the next several years, it would be useful to develop research strategies to acquire the activity data that will be needed to support emissions modeling, such as thorough surveys of application practices, typical weather conditions, and fertilizer quality.

3.4 RECOMMENDATIONS OTHER SOURCE CATEGORIES

Information was insufficient to develop emissions estimates for ammonia injection for NO_x control and biosolids, sources which may be significant on local geographic scales. We recommend a survey of power plants in the CENRAP region in order to identify facilities that use the ammonia-injection control technology and to assess the potential importance of this source category for the CENRAP inventory.

Development of an inventory for biosolids is more complicated. Suitable emission factors and models are currently unavailable for use, and we have not identified any ongoing research projects related to this area. Should an emissions model be developed at a future date, it will likely be necessary to gather activity data that are not currently tracked: facility-specific estimates of sludge quantities produced, sludge management and disposal practices, ammoniacal contents of produced sludges, and weather conditions.

1. INTRODUCTION

In support of the Central States Regional Air Planning Association's (CENRAP) need to develop a regional haze plan, Sonoma Technology, Inc. (STI) developed an ammonia emission inventory for the region. This Methods Document presents the techniques applied to develop the inventory. In summary, we used the Carnegie Mellon University (CMU) model—an ammonia emissions modeling tool—and supplemental emissions estimation techniques for miscellaneous source categories that were omitted from the CMU model.

Inventory development began with the identification and evaluation of information resources to enhance version 3.0 of the CMU model. STI previously evaluated an earlier version (2.0) of the CMU model as part of a study for the Lake Michigan Air Directors Consortium (LADCO) (Chinkin et al., 2003), and CMU incorporated many of STI's recommendations in the most recent version of the model (version 3.0), which was released in April 2003. This Methods Document identifies further revisions that were made to improve the CMU model outputs for the CENRAP region, including revisions to the emission factors and updates of the activity data.

Consistent with the project goals presented in the Work Plan (Coe, 2003), this Methods Document primarily discusses emission estimation techniques for two source categories: livestock production and fertilizer use. In addition, it provides a cursory treatment of emissions sources that are omitted from version 3.0 of the CMU model, such as landfills, non-road mobile sources, and ammonia refrigeration.

1.1 SUMMARY OF RECOMMENDED METHODS

We estimated ammonia emissions for thirteen source categories listed in **Table 1-1**. For livestock production, fertilizer application, and biogenic sources (soil), we used the CMU model to estimate emissions, but only after the model's emission factors and activity data were revised and/or updated as summarized in **Table 1-2**. We also used the CMU model to estimate emissions for six other categories, including publicly owned treatment works (POTWs) and on-road mobile sources. For these categories, we simply used the version 3.0 model outputs without modification. In addition, we adopted existing emission inventories for point sources. Lastly, we estimated emissions for three source categories omitted from the CMU model: landfills, non-road mobile sources, and ammonia refrigeration.

Table 1-2 briefly identifies recommended sources of emission factors and activity data. **Tables 1-3 and 1-4** list recommended temporal profiles and spatial allocation surrogates by source category. The diurnal profile for livestock house at feedlots was derived from a study of ammonia emissions from swine operations (Aarnink, 1997). The diurnal profile for fertilizer application and free-range livestock was based on a study of nitric oxide fluxes from soil (Anderson and Levine, 1987). The diurnal profile for emissions from soil was derived from a recent European research project conducted on grasslands (Sutton et al., 2002). Diurnal allocations for other categories were based on default profiles assigned by the Sparse Matrix Operator Kernal Emissions Modeling System (SMOKE). The subsequent chapters of this Methods Document provide many more details about the information summarized in Tables 1-2 through 1-4.

Table 1-1. Summary of approaches to estimate ammonia emissions.

Source Category	Emissions Estimation Approach: Use CMU Model, Without Revisions	Emissions Estimation Approach: Use CMU Model, With Revisions	Emissions Estimation Approach: Generate or Adopt Estimates Independently from CMU Model
Included in CMU model:			
Livestock		✓	
Fertilizer		✓	
POTWs	✓		
Human perspiration and respiration	✓		
Domestic animals	✓		
Wild animals	✓		
Wildfires	✓		
On-road mobile sources	✓		
Industrial point sources			✓
Biogenic sources ("soil")		✓	
Not included in CMU model:			
Landfills			✓
Ammonia refrigeration			✓
Non-road mobile sources			✓

Table 1-2. Summary of emission factors and activity data sources.

Source Category	Emission Factor(s)	Activity Data	Comments
Livestock production	Retain factors from CMU Model 3.0 (Region-specific characteristics will be applied through temporal and spatial allocations).	Existing 1997 USDA Agricultural Census data will be improved with 2002 NASS population data and data for confined animal feeding operations (CAFO), which will be obtained from individual states.	Emissions from CAFOs will be treated as point sources.
Fertilizer application	Refine factors from CMU model to make them more specific to climate and soil types in the CENRAP.	2002 fertilizer usage data from the Association of American Plant Food Control Officials (AAPFCO) will be used with additional data from state agencies.	The CMU model currently uses 1995 AAPFCO data.
Landfills	Use equations published in the Emission Inventory Improvement Plan (EIIP) Volume VIII and a published ratio of methane to ammonia emissions.	Obtain waste in place (WIP) data from EPA's Landfill Methane Outreach Program (LMOP) database and use with additional data from state agencies.	The EIIP methodology generates methane emissions, which are then converted to ammonia.
Ammonia refrigeration	Apply an employment-based emission factor.	Use county-level employment data published by the U.S. Census Bureau.	Emissions estimates are based on employment in specific food processing industries.
Non-road mobile sources	N/A	N/A	Emissions will be taken directly from the 1999 National Emission Inventory (NEI) non-road inventory.
Point sources	N/A	N/A	Emissions will be taken directly from the 2001 Toxics Release Inventory (TRI) and 1999 NEI inventories.
Biogenic sources (soil)	Replace factors used in the CMU model with those recently published by Battye et al. (2003).	Use soil-type data from the CMU model with no revisions.	Emissions estimates from this source category are highly uncertain.

Table 1-3. Summary of seasonal profiles and spatial surrogates.

Source Category	Source of Information for Seasonal Profiles	Source of Information for Spatial Surrogates
Livestock Production	Use monthly allocation factors published by Pinder et al (2003).	Rangeland landuse category from the EPA's Biogenic Emissions Landcover Database (BELD).
Fertilizer Application	Develop new seasonal profiles.	Cropland landuse category from the EPA's BELD data.
Landfills	Use SMOKE default temporal profiles assigned by Source Category Code (SCC).	Facility-reported coordinates, addresses, or centroid of zip codes.
Point Sources		
Ammonia Refrigeration	Use SMOKE default temporal profiles assigned by Source Category Code (SCC).	County area.
Non-road Mobile Sources		
Biogenics (soil)	Use diurnal profile from recent European study (Sutton et al., 2002).	County area.

Table 1-4. Summary of diurnal profiles.

Hour of Day	Proportion of Total Daily Emissions (%)		
	Livestock Housed at Feedlots	Fertilizer/Free-range Livestock	Soil
Midnight-1 a.m.	3.9%	2.0%	3.9%
1-2 a.m.	4.0%	2.0%	3.1%
2-3 a.m.	4.0%	2.0%	2.3%
3-4 a.m.	4.1%	2.0%	1.6%
4-5 a.m.	4.1%	2.0%	1.1%
5-6 a.m.	4.2%	2.1%	0.8%
6-7 a.m.	4.2%	2.8%	0.7%
7-8 a.m.	4.2%	4.1%	0.9%
8-9 a.m.	4.2%	7.0%	1.5%
9-10 a.m.	4.3%	7.4%	2.3%
10-11 a.m.	4.3%	8.2%	3.4%
11 a.m.-Noon	4.3%	8.2%	4.5%
Noon-1 p.m.	4.3%	8.1%	5.5%
1-2 p.m.	4.3%	7.8%	6.4%
2-3 p.m.	4.3%	6.5%	6.9%
3-4 p.m.	4.3%	4.1%	7.1%
4-5 p.m.	4.2%	4.1%	7.1%
5-6 p.m.	4.2%	3.1%	6.9%
6-7 p.m.	4.2%	2.9%	6.7%
7-8 p.m.	4.2%	2.9%	6.4%
8-9 p.m.	4.1%	2.9%	6.0%
9-10 p.m.	4.1%	2.9%	5.5%
10-11 p.m.	4.0%	2.9%	5.0%
11 p.m.-Midnight	4.0%	2.0%	4.5%

1.2 IMPORTANT PREMISES AND ASSUMPTIONS

The methods that we selected for use were based on several important premises or assumptions:

- For livestock populations, the grounds for selecting 2002 county-level National Agricultural Statistics Service (NASS) data—which are based on local surveys—is that we gauged them to be an improvement over the older population data reported in the 1997 USDA Agricultural Census (which is the latest version of the Agricultural Census available).
- We assumed that temporal allocation factors for dairy cows (seasonal) and swine (diurnal) are reasonably similar to those of other types of livestock.
- For fertilizer application, emission factors developed by the European Environment Agency (2001) for similar climate zones and similar types of fertilizers were presumed to be applicable to fertilizers used in the United States.
- Natural Resources Conservation Service (NRCS) classifications of soil types were presumed to be representative and indicative of the fertilizer emission factors that are most applicable to each county in the CENRAP region.
- We assumed that diurnal patterns of nitric oxide flux from soil emissions observed by Anderson and Levine (1987) can be used to approximate diurnal patterns of ammonia emissions from fertilizer application (Chinkin et al., 2003).
- For landfills, the U.S. Environmental Protection Agency's (EPA) Landfill Methane Outreach Program (LMOP) is assumed to be sufficiently complete for those states where other data is unavailable.
- For point sources, a combination of ammonia emissions data contained in the 2001 Toxics Release Inventory (TRI) and 1999 National Emissions Inventory (NEI) are expected to be sufficiently complete for the purposes of this inventory.
- We expected that the emission factors and activity data contained in version 3.0 of the CMU model were sufficient to characterize ammonia emissions from POTWs, human beings, domestic animals, wild animals, wildfires, and on-road mobile sources. In addition, we assumed that the hidden algorithms in version 3.0 of the CMU model function correctly and as reported in the model documentation for these sources.

2. LIVESTOCK PRODUCTION

2.1 OVERVIEW

For other inventories, livestock and poultry operations have been estimated to be the most significant sources of ammonia emissions nationwide (U.S. Environmental Protection Agency, 2000). Nationally, the EPA estimated that ammonia emissions from commercial animal husbandry in the United States were dominated by calves and cattle (78%), followed by hogs and pigs (19%). The other 3% of emissions came from chickens (2%) and sheep (1%).

In order to estimate the magnitude of livestock and poultry emissions for a given state or county, local animal populations are needed, as well as emission factors that quantify pounds of ammonia emissions per head of livestock. Ideally, emission factors also should vary with weather conditions, animal management practices, and manure management practices. However, emission factors with this level of detail generally are unavailable. To compensate, we used a new study recently published by Pinder et al. (2003) and discussed in Section 2.4 to generate an inventory for livestock that reasonably represents region-specific temporal patterns.

2.2 LIVESTOCK AND POULTRY EMISSION FACTORS

A wide variation in livestock emissions is reported in different studies in the United States and Europe. Version 2.0 of the CMU model—previously evaluated by STI for the LADCO project—made use of composite emission factors compiled by Battye et al. (1994) for each U.S. Department of Agriculture (USDA) category. The Battye report recommended European animal waste ammonia factors, which were developed by Asman (1992) on the basis of measurements collected in the 1980s in Europe, for use in the United States. However, STI concluded that these factors might not be well-suited for estimating emissions in the United States because of differences in both animal waste management practices and animal husbandry practices between Europe and the United States. For example, animal waste in the United States is commonly stored in lagoons, and ranches are generally larger in size and enable wider cattle grazing activity. Confined cattle with diets high in nitrogen, as are more common in Europe, tend to emit more ammonia so that European emission factors may over-represent cattle emissions in the United States.

Version 3.0 of the CMU model utilizes emission factors recommended by the EPA's Office of Research and Development (ORD) (U.S. Environmental Protection Agency, 2002b). The original source of the ORD factors were Bouwman and Van der Hoek (1997). Although these, too, are European emission factors, the ORD considered them to be more representative of U.S. agricultural practices on the basis of a detailed mass balance. In addition, these emission factors equate to roughly 25% of excreted nitrogen, which is more in line with current thinking. Therefore, we used the ORD-recommended emission factors as they exist in version 3.0 of the CMU ammonia model.

2.3 LIVESTOCK AND POULTRY ACTIVITY DATA

Version 3.0 of the CMU model, like its predecessor, relies exclusively on the 1997 USDA Agricultural Census as its source of livestock and poultry activity data. This census is conducted every five years, and data for the 2002 study will not be released until spring of 2004. Therefore, STI will supplement the 1997 data with estimates from the NASS, which are generated annually. Each January and July, the NASS conducts surveys of a sample group of livestock producers, taking steps to ensure statistically representative coverage of all livestock operations in each state. These surveys are then used to produce an estimated livestock inventory by county. The vintages of the NASS agricultural surveys vary somewhat by state, so we will use the most current estimates available for each. **Table 2-1** shows the vintages of all available NASS estimates more current than 1997.

Table 2-1. Vintages of most current NASS estimates by state.

State	NASS Livestock Types			
	Beef Cattle	Milk Cows	Hogs & Pigs	Sheep/ Goats
Arkansas	2002	2000	2000	N/A
Iowa	2002	2002	N/A	N/A
Kansas	2002	2002	N/A	2001
Louisiana	2002	2002	N/A	N/A
Minnesota	2002	2002	N/A	2002
Missouri	2002	2002	N/A	2002
Nebraska	2002	2001	N/A	2002
Oklahoma	2002	2002	1999	2002
Texas	2002	2002	N/A	2000

Note: N/A indicates none available from NASS or that data pre-date the 1997 Agricultural Census. For these cases, 1997 Agricultural Census data will be used.

Some limitations are associated with the 1997 USDA Agricultural Census and the NASS data. First, these estimates do not reflect some factors that affect actual state cattle populations, such as seasonal import and export of animals to other states. Also, these data sources do not contain any information on the locations of concentrated animal feeding operations (CAFOs). Feedlots service thousands of animals in fairly confined spaces, such that emissions from the facilities are better treated as point sources. To address these limitations, we contacted agricultural and environmental agencies or departments in each state to request information about livestock populations and seasonal movements of herds, as well as data on CAFO animal populations which might be available from National Pollutant Discharge Elimination System (NPDES) records or other sources. Though no useful data was available on herd movements, we were able to obtain current permit data on CAFO locations and animal populations from all nine CENRAP states. This allowed us to subtract livestock populations at the various CAFOs from the CMU model's county-wide totals so that emissions from those facilities could be treated as point sources and allocated to specific CAFO locations.

During this process of updating livestock populations, it was noticed that for several counties the reported CAFO animal populations greatly exceeded the county totals found in the NASS and/or census data. Investigation revealed that for CAFO permitting purposes, facilities report maximum capacities rather than actual animal populations. While it can be assumed that most CAFOs attempt to operate near their capacity, there are situations where this does not appear to be the case, or where facilities are reporting an annual throughput rather than a one-time population figure. For example, an auction yard named OKC West Livestock Market in Canadian County, Oklahoma, reports a beef cattle population of 198,797 head, which turned out to be the total number of animals moved through the facility in one year (for comparison, the 1997 Agricultural Census identifies only 25,700 head of beef cattle in the entire county). Because of such anomalies, CAFO data for some counties were scaled down to ensure that total animal population counts remained comparable with data reported in NASS estimates and the 1997 Agricultural Census.

Finally, we utilized recent estimates of ammonia emissions from dairy farms published by Pinder et al. (2003) instead of estimates produced by the CMU model for this category. The estimates calculated by Pinder et al. (2003) were derived using a model that considers manure management practices and climatic conditions and, from these, calculates month-specific and region-specific emission factors for dairy cows. Pinder et al. (2003) applied these emission factors to dairy cow populations from the 1997 USDA Agricultural Census to produce a county-level emissions inventory for the entire United States.

2.4 LIVESTOCK AND POULTRY TEMPORAL ALLOCATION

2.4.1 Seasonal Allocation

The CMU model assumes a flat, unvarying rate for livestock emissions. Earlier, STI recommended (Chinkin et al., 2003) the use of a seasonal distribution proposed by Gilliland et al. (2002), which is based on modeled results. While there were concerns about the use of modeled outputs to adjust emission rates, a non-varying seasonal distribution seemed even less likely to reflect real-world conditions.

However, the recent dairy farm model developed by Pinder et al. (2003) is a new source of county-specific seasonal allocation factors that seem more representative of emissions from livestock. Side-by-side comparison shows that the seasonal variability in Pinder et al.'s aggregate national-scale inventory matches up somewhat comparably with the monthly allocation factors proposed by Gilliland et al. (see **Table 2-2 and Figure 2-1**), with some differences.

Table 2-2. Side-by-side comparison of monthly seasonal allocation factors (Proportions are relative to annual average emission rates).

Month	Gilliland Seasonal Allocation Factors	Pinder Seasonal Allocation Factors
January	67%	33%
February	75%	36%
March	75%	78%
April	82%	161%
May	126%	139%
June	164%	122%
July	183%	116%
August	154%	119%
September	115%	120%
October	73%	150%
November	51%	78%
December	51%	50%

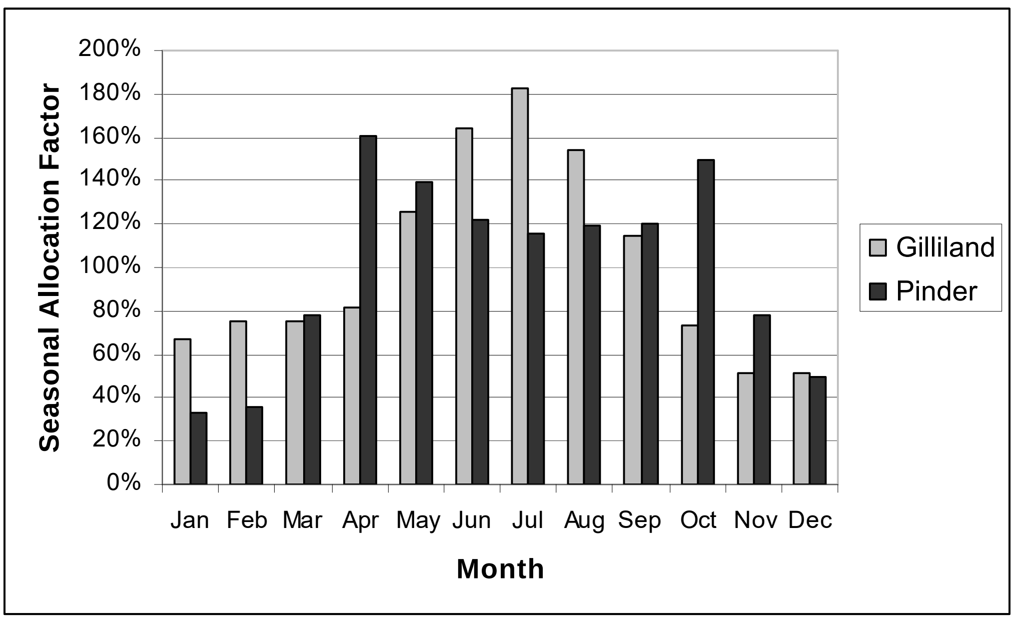

Figure 2-1. Graphical comparison of monthly seasonal allocation factors.

Though the Pinder et al. study was specifically related to dairy cattle, we expect that the allocation factors derived from this study are more representative of real-world conditions than Gilliland's reverse-modeling approach. Therefore, we will use Pinder et al.'s profiles to seasonally allocate emissions from all livestock. Because the Pinder et al. model takes local conditions into account (emission factors are generated for each county in the United States based on climate, husbandry practices, etc.), this approach will result in the development of

county-specific seasonal allocation factors for this source category. (It should be noted that the national-level seasonal allocation shown in Table 2-2 is almost certainly weighted toward the colder northern states, which have the most dairies and would not be suitable for the entire CENRAP domain).

2.4.2 Diurnal Allocation

Aarnink (1997) reported that ammonia emissions from houses with rearing and fattening pigs had higher emissions during the day than during the night: +10% for rearing pigs and +7% for fattening pigs. For rearing pigs, emissions peaked in the morning, but for fattening pigs, they peaked in the afternoon. We used this information to develop the diurnal profile for ammonia emissions from pigs shown in Table 1-3 (Chinkin et al., 2003). Because information is currently unavailable to determine a diurnal profile of emissions from other types of livestock, we applied the swine diurnal profile to feedlot cattle, poultry, and other livestock that tend to be housed at close quarters.

For rangeland cattle, manure and urine depositions are spread out over a much larger area than would be the case with cattle housed at feedlots. It is our judgment that diurnal emissions patterns for such cattle are more likely to be consistent with emissions from fertilizer application than with emissions from housed swine. Therefore, we used a diurnal profile developed from nitric oxide fluxes from soil (Anderson and Levine, 1987) that is also being applied to emissions from fertilizer application (see Section 3.4.2).

2.5 LIVESTOCK AND POULTRY SPATIAL ALLOCATION

CAFOs were treated as point sources, with emissions from those facilities allocated according to specific reported coordinates. Other emissions from livestock and poultry will be spatially allocated according to the "rangeland" land type category, an aggregate of the "pasture" and "grassland" landuse categories available from the EPA's Biogenic Emissions Landcover Database (BELD).

3. FERTILIZER APPLICATION

3.1 OVERVIEW

In other inventories, fertilizer application has been estimated as the second most abundant source of ammonia emissions nationwide (U.S. Environmental Protection Agency, 2000). Emissions from this source can be calculated by applying an appropriate emission factor to the amount of fertilizer applied. Emission factors vary by fertilizer type, application method, soil type, and climate.

3.2 FERTILIZER EMISSION FACTORS

Historically, the EPA recommended the use of Battye et al. (1994) emission factors—in part, because they were accompanied by supporting data and an explanation of factor development. These emission factors range from 24 lb to 264 lb of NH_3 emitted per ton of fertilizer nitrogen applied (or equivalently, 1% to 5% of NH_3 as nitrogen emitted per ton of fertilizer nitrogen applied). The emission factors in version 2.0 of the CMU model were similar to those recommended by EPA and reported by Battye et al. (1994)

Because ammonia emissions from fertilizer are a function not only of fertilizer type but also soil type and climate, STI recommended (Chinkin et al., 2003) the use of emission factors from the European Environment Agency (2001) which are fertilizer type-, soil type-, and climate-dependent. The European factors were developed according to the following classification system:

- Group I – Warm, temperate areas with a large proportion of calcareous soils.
- Group II – Temperate and warm-temperate areas with some calcareous soils (or managed with soil pH>7), but with large areas of acidic soils.
- Group III – Temperate and cool-temperate areas with largely acidic soils.

Version 3.0 of the CMU model makes use of these European emission factors, assigning whole states to one of the groupings listed above:

- Group I: Texas
- Group II: Arkansas, Kansas, Louisiana, and Missouri
- Group III: Iowa, Minnesota, and Nebraska

While this approach is an improvement over that used in the previous version of the CMU model, greater refinement of emission factors by geography is possible and preferable. As **Table 3-1** shows, emission factors for some fertilizer types vary widely among classifications. For ammonium sulfate-based fertilizers, for example, the Group I emission factor is 200% higher than the Group III factor and 50% higher than the Group II factor.

Table 3-1. Fertilizer emission factors used in CMU model version 3.0 (%N volatilized as NH_3).

State	EEA Group	Mix/ Ammonium Nitrate	Ammonium Sulfate	Calcium Ammonium Nitrate	Urea	Misc.
Texas	I	3	15	3	20	8
Arkansas	II	2	10	2	15	6
Kansas	II	2	10	2	15	6
Louisiana	II	2	10	2	15	6
Missouri	II	2	10	2	15	6
Oklahoma	II	2	10	2	15	6
Iowa	III	1	5	1	15	7
Minnesota	III	1	5	1	15	7
Nebraska	III	1	5	1	15	7

Because of these large differences, we more fully implemented the European approach through the use of an integrated geographic information system (GIS). The NRCS State Soil Geographic database (STATSGO) was used to identify the dominant soil type (calcareous or acidic) in each county so that the best possible emission factors could be applied. The emission factors in the CMU model were updated as necessary.

3.3 FERTILIZER ACTIVITY DATA

National fertilizer use data are available from the Association of American Plant Food Control Officials (AAPFCO). These data contain semi-annual sales distributions at a county-level for over 100 different types of fertilizers, including those that emit ammonia. Version 3.0 of the CMU model uses AAPFCO data from 1995; therefore, we prepared an updated fertilizer sales database from the 2002 AAPFCO data. State agricultural experts were contacted for further information on fertilization consumption, but no improvements to the AAPFCO data proved to be available.

3.4 FERTILIZER TEMPORAL ALLOCATION

3.4.1 Seasonal Allocation

In version 3.0 of the CMU model, six-month sales data from AAPFCO was broken down into a monthly resolution via an algorithm that incorporated fertilizer timing based on crop calendars and application rates. This algorithm operates on separate six-month intervals—first distributing spring sales data over the first six months of the year, then fall data over the second half of the year. Such a method assumes, of course, that all fertilizer purchased in a given semi-annual period is completely consumed during that time frame.

However, a survey of the AAPFCO data showed that a significant number of records report zero or negative values for fertilizer shipped during the fall cycle (second half of the year). This anomaly is due to returns of unused fertilizer in the fall to fertilizer sellers. While these anomalies tend to occur in counties with relatively small fertilizer sales, they do indicate that fertilizer is not always consumed in the season during which it was purchased. Therefore, they may be indicative of a larger scale, systematic bias throughout the inventory.

Furthermore, the CMU model calculates a single temporal distribution for each state based on the total acreage of various crop types within the state. This approach does not take into account local variations in crop types, which can be considerable across the large states found within the CENRAP region.

To address these concerns, we generated revised temporal algorithms that summed the semi-annual sales data for each county and redistributed the annual total over the twelve months of the year by using county-specific crop acreages published by NASS and the crop calendars and fertilizer timing rates currently employed by the CMU model.

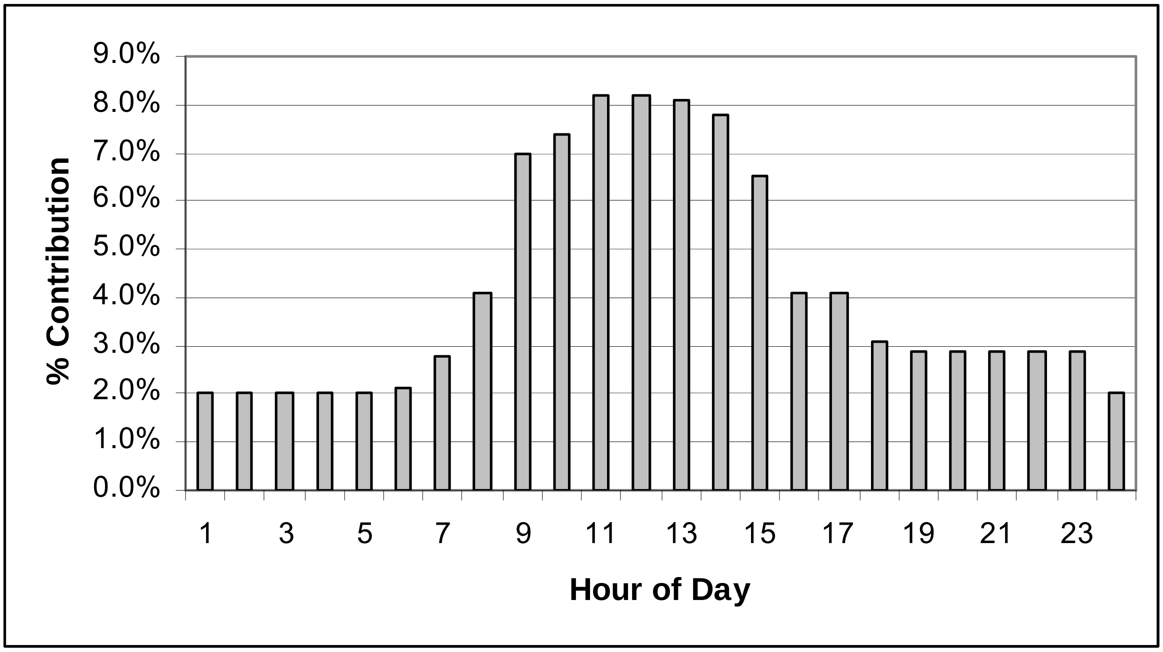
3.4.2 Diurnal Allocation

Midwest Research Institute (1998) found that hourly emission rates of ammonia from fertilizer applications exhibit diurnal patterns that follow temperature fluctuations. Anderson and Levine (1987) found a similar pattern in diurnal nitric oxide fluxes from soil. Because nitric oxide flux profiles are better quantified than ammonia flux profiles, we used them to create the diurnal profile shown in **Figure 3-1**. Although a profile that is directly based on good-quality ammonia emissions measurements would be preferable, we believe that, at present, the better quality of the nitrogen oxides data is a good rationale for its use (Chinkin et al., 2003).

3.5 FERTILIZER SPATIAL ALLOCATION

Emissions from fertilizer application will be spatially allocated to cropland areas available from EPA's BELD.

Figure 3-1. Diurnal ammonia emissions profile for fertilizer application (% of total daily emissions).



4. OTHER SOURCE CATEGORIES

4.1 OVERVIEW

Emissions from other source categories omitted from the CMU model were estimated in order to compile a complete inventory. However, because these sources were assigned a lesser priority than livestock and fertilizer application, we derived emissions estimates by using simple methods.

We considered several source categories for possible inclusion in the final inventory, including landfills, biomass burning, composting, ammonia refrigeration, non-road mobile sources, geothermal emissions, and ammonia injection for NO_x control. We concluded that emissions should be estimated for all of these except biomass burning, composting, geothermal sources, and ammonia injection for NO_x control. These categories were excluded for the following reasons:

- Biomass Burning. The CMU model estimates ammonia emissions from wildfires, but not planned burning. However, because a planned burning emissions inventory, which will include ammonia, is being developed by STI under a different work assignment, this source category will be addressed through that separate project.
- Composting. Ammonia is released during the degradation of organic waste at composting operations. A 2000 inventory of ammonia emissions prepared by AVES for California's South Coast Air Basin (Botsford et al., 1999) utilized an emission factor of 2.755 pounds of ammonia per ton of material processed to estimate emissions from this source. In that inventory, composting operations accounted for 9.7 tons per day of ammonia emissions, or 5.25% of the total inventory. However, this estimate was based on an annual throughput of 2,445,600 tons of waste in the South Coast Air Basin alone. By comparison, the only CENRAP states for which composting activity data were readily available—Iowa and Minnesota—report statewide annual throughputs of 628,000 tons and 462,000 tons, respectively. Based on this indication that composting efforts are not likely to be widespread in the CENRAP region and a lack of easily accessible data for seven states, it is recommended that this source category be excluded from the current inventory effort.
- Geothermal Emissions. Geothermal power-generation facilities release significant ammonia emissions from cooling towers. However, the *Renewable Energy Annual 1996* (Energy Information Administration, 1997) indicates that "known geothermal resource areas in the United States with resource conditions sufficient to generate electricity are rare, occurring domestically only in the Western United States and Hawaii."
- Ammonia Injection for NO_x Control. One technology for controlling NO_x emissions from stack gases is the injection of ammonia into the exhaust of boilers or gas turbines—an approach that is primarily used at power generation facilities. Excess ammonia that does not react with NO_x is emitted to the atmosphere and is referred to as "ammonia slip."

In an attempt to determine if any facilities in the CENRAP states use this technology, we searched control codes contained in the 1999 NEI database. No facilities reported the use of ammonia injection in the NEI. A telephone survey of power generation facilities would be necessary to confirm the absence of these controls. However, such a survey is beyond the scope of the current project.

The remainder of this chapter highlights emissions estimations methodologies for the new categories that were included in the final inventory, as well as two other source categories (point and biogenic sources) for which improvements were made to the CMU approach.

4.2 LANDFILLS

According to *EIIP Volume VIII: Estimating Greenhouse Gas Emissions* (Emission Inventory Improvement Program, 1999), methane emissions from landfills depend on three key factors: (1) total "waste in place" (WIP), which is defined as the sum of waste disposal over a 30-year period; (2) landfill size; and (3) location in an arid or non-arid climate. When WIP data is available for specific landfills within a state, the following equations can be used to estimate methane emissions:

<u>Small Landfills (less than 1.1 millions tons of waste in place)</u>

- Arid climate (less than 25 inches of rainfall per year):

$$CH_4\ (\text{tons/year}) = WIP_{tons} \times \frac{0.27\ \text{ft}^3/\text{day}}{\text{ton}} \times \frac{0.0077\ \text{tons}\ CH_4/\text{yr}}{\text{ft}^3/\text{day}} \qquad \textbf{(4-1)}$$

- Non-arid climate (25 inches or more of rainfall per year):

$$CH_4\ (\text{tons/year}) = WIP_{tons} \times \frac{0.35\ \text{ft}^3/\text{day}}{\text{ton}} \times \frac{0.0077\ \text{tons}\ CH_4/\text{yr}}{\text{ft}^3/\text{day}} \qquad \textbf{(4-2)}$$

<u>Large Landfills (over 1.1 millions tons of waste in place)</u>

- Arid climate (less than 25 inches of rainfall per year):

$$CH_4\ (\text{tons/year}) = [417{,}957\ \text{ft}^3/\text{day} + \frac{0.16\ \text{ft}^3/\text{day}}{\text{ton}} \times (WIP_{tons})] \times \frac{0.0077\ \text{tons}\ CH_4/\text{yr}}{\text{ft}^3/\text{day}} \qquad \textbf{(4-3)}$$

- Non-arid climate (25 inches or more of rainfall per year):

$$CH_4\ (\text{tons/year}) = [417{,}957\ \text{ft}^3/\text{day} + \frac{0.26\ \text{ft}^3/\text{day}}{\text{ton}} \times (WIP_{tons})] \times \frac{0.0077\ \text{tons}\ CH_4/\text{yr}}{\text{ft}^3/\text{day}} \qquad \textbf{(4-4)}$$

We have contacted state agencies to obtain landfill WIP estimates, and data has been obtained from Iowa, Kansas, Texas, and Minnesota. For the remaining CENRAP states, we utilized data available through EPA's LMOP database. This program is voluntary, and the

LMOP database only includes data for landfills that use gas recovery systems or have the potential to employ such systems in the future. Though the database is not likely to be exhaustive for any of the CENRAP states, it does contain records for 372 landfills within the CENRAP region, and only Arkansas appears to have data that are severely incomplete (with only three data records for that state).

We used the equations above to estimate methane emissions for each landfill for which we have WIP data, then calculated ammonia emissions by using a published ratio of 0.7% ammonia to methane (Eggleston, 1992). We apportioned landfill emissions to the best spatial data available—either the facility latitude/longitude (for state-specific data) or the centroid of the postal code area (ZIP) where each landfill is located (for facilities in the LMOP database).

For Arkansas, landfill emissions were treated as an area source, and a statewide estimate of ammonia emissions was calculated based on an alternative population-based method described in the EIIP documentation. This statewide emissions total was then disaggregated to the county level based on population.

4.3 AMMONIA REFRIGERATION

Ammonia is commonly used as a refrigerant at food processing facilities. The Occupational Safety & Healthy Administration (OSHA) of the U.S. Department of Labor has identified common industries that use ammonia refrigeration systems (Occupational Safety & Health Administration, 2002). These industries and their corresponding NAICS (North American Industry Classification System) number appear in **Table 4-1**.

Table 4-1. List of industries that use ammonia refrigeration.

Industry	NAICs
Meat, poultry, and fish processing facilities	31161, 31171
Dairy and ice cream plants	31151, 31152
Wineries and breweries	31212, 31213
Juice and soft drink processing facilities	31211
Cold storage warehouses	49312

To estimate emissions from this source, we applied an emission factor that was reported by Battye et al. (1994): 187 kg NH_3/employee. This factor is based on the assumption that annual production levels of ammonia refrigerants are roughly in material balance with fugitive losses from refrigeration systems. If a significant fraction of ammonia refrigerants is recovered for disposal, stabilization, or re-use in non-refrigeration applications, or if the demand for new refrigeration systems outstrips the demand for system recharges, then this emission factor should represent a conservatively high estimate.

We contacted the International Institute of Ammonia Refrigeration to determine the relative market demands for ammonia refrigerants (manufactures of new systems versus

recharges of old systems) and to determine the likely environmental fates of manufactured ammonia refrigerants (fugitive losses, recovery, etc.). However, we were unable to acquire definitive information from this resource. Additionally, we are currently locating the latest issue of the serial, *Chemical Economics Handbook* by Stanford Research Institute, which includes a chapter of statistics and discussions about the ammonia manufacturing industry. Given the scheduled delivery of the ammonia emission inventory files, we were unable to review this resource in time for delivery. However, if the *Chemical Economics Handbook* contains relevant and useful information, then we will (at a later time) issue a revision memorandum to the CENRAP with simple instructions for updating the emissions estimates for ammonia refrigeration.

In order to verify the scale of the emission factor, we determined that annual production of ammonia for refrigeration uses in the United States is between 270,000 Mg and 350,000 Mg (Battye et al., 1994; International Institute of Ammonia Refrigeration, 2003). To prevent the possibility of significant double-counting, we confirmed that this figure is much larger than total air releases of ammonia reported by United States facilities in the food products industry (SIC 20) for the 2001 TRI (approximately 7400 Mg). For the industries listed in Table 4-1, total United States employment equals approximately 1 million employees (U.S. Census Bureau, 2003). Thus, these figures yield a factor of 270 to 350 kg NH_3/employee-yr, which is on the same order of magnitude as the factor estimated by Battye et al. (1994), although it is 44% to 87% larger.

4.4 NON-ROAD MOBILE SOURCES

NEI contains ammonia emissions from non-road mobile sources. These data will be extracted and incorporated into the final inventory. It should be noted that the most current NEI data are for 1999, or three years out of date. Because this is a minor category, we will consider 1999 emissions to be reasonably representative of 2002 emissions.

4.5 POINT SOURCES

To quantify ammonia emissions from industrial/point sources, the CMU model takes county-level emissions from the EPA’s 1995 TRI and distributes these totals evenly over 12 months of the year for each county. It should be noted that the CMU model does not contain any location information on these sources, meaning that they cannot be treated as true “point sources”.

However, we have evaluated the TRI to be incomplete for several types of point sources, such as power generation facilities. Reporting requirements for the TRI limit the inventory to specific industrial sectors such as manufacturing, mining, and petroleum processing (U.S. Environmental Protection Agency, 2002c). Our preliminary investigation showed that a number of ammonia sources included in the 1999 NEI do not appear in the TRI data, and there appears to be little overlap between these two inventories. For example, the 2001 TRI contains ammonia emissions data for 211 facilities in the state of Texas, which emit 2,603 tons per year of ammonia. The NEI contains emissions data for 87 facilities—mostly power generation plants, none of which are listed in the TRI—that emit 1,834 tons per year of ammonia.

In order to improve upon the CMU model output for point sources, we downloaded the most current TRI data available (year 2001), and we located the emissions as point sources according to the reported coordinates of each facility. In addition, we augmented the TRI point source inventory with point source emissions estimates and facility locations reported in the 1999 NEI.

To check this approach, we verified that emissions from an important source of ammonia emissions—fertilizer manufacturing—are adequately represented in the point source inventory. Kansas was examined as a sample state, and ammonia emissions in the NEI and TRI inventories from fertilizer manufacturing amounted to 12,400 tons. Using emission factors from AP-42 (U.S. Environmental Protection Agency, 2002a) and fertilizer sales data for Kansas contained in the CMU model, an emissions estimate of 14,650 tons of ammonia from fertilizer manufacturing was calculated. Though this calculation was crude, it does indicate that the data contained in the NEI and TRI inventories will provide a reasonable representation of emissions from this source.

4.6 BIOGENIC SOURCES

As the documentation provided with the CMU emissions model states, biogenic (or "soil") emissions estimates are highly uncertain. Literature sources indicate that the soil-plant canopy system can be a source of ammonia emissions under some conditions and a sink under other conditions (Strader et al., 2001; Sutton et al., 2002). The emission factors used in Version 3.0 of the CMU model were derived from a variety of sources, and activity data on soil types was obtained from the EPA's GIRAS land-use data set.

Preliminary CMU model runs indicated that emissions from soil accounted for 50% of the total annual ammonia inventory. This result seemed unlikely; therefore, we performed a literature search to seek improved emission factors. We chose to apply emission factors that were selected for use by Battye et al. (2003), which were based on factors reviewed or published by Schlesinger and Hartley (1992), Buowman et al. (1997), Kinnee et al (1997), and Van Der Hoek (1998). **Table 4-2** shows a comparison between the CMU model's emission factors and those selected for use.

The result of altering the CMU model's emission factors was a 93% reduction in biogenic emissions across the CENRAP domain. Thus, we estimated that biogenic emissions account for 7% of the total CENRAP ammonia inventory. Battye et al. (2003) calculated similar percent contributions—about 6.6% and 6.3%—for emission inventories in North Carolina and California's San Joaquin Valley.

However, it is important to note that these results are *highly uncertain*. Based on very recent research projects conducted on grasslands in Europe (Sutton et al., 2002), results continue to demonstrate that relatively undisturbed environments with low nitrogen inputs tend to absorb ammonia from the atmosphere, while lands with high nitrogen inputs—from fertilizer, decomposing plant matter, manure, large herds or flocks of wild animals, acid rain deposition, or other sources—tend to emit ammonia. Reported emission rates range from –590 kg/km^2/yr to +2600 kg/km^2/yr and areas may act as net sinks or net sources of ammonia at different times of the year and at different times of the day (Sutton et al., 2002). It will be very important to

consider the uncertainties in the biogenic emissions estimates when evaluating air quality modeling sensitivities and uncertainties.

Table 4-2. Comparison of soil emission factors.

Soil Type	Emission Factor (kg/km^2/yr)	
	CMU Model	STI Update
Residential, Commercial, Industrial, Urban	160	10
Cropland, Pasture, Other Agricultural Land	1200	30
Orchards, Groves, Vineyards	1296	30
Rangeland	370	40
Forests	140	120
Wetlands	370	120
Dry Salt Flats	6.7	10
Transitional Areas	370	10
Mixed Barren Land	60	10
Unknown	370	10

5. PREPARATION OF DIGITAL FILE SYSTEMS

5.1 NATIONAL EMISSIONS INVENTORY INPUT FORMAT FILE CONVERSION

The CMU model creates output files in version 2.0 of the National Emissions Inventory Input Format (NIF), with the NIF 2.0 records containing ammonia emissions by county, source category code (SCC), and month. These output files were updated to the latest version of NIF (version 3.0).

5.2 SMOKE-COMPATIBLE FILE SYSTEMS

In order to process these emissions data through SMOKE, the NIF files were converted to Inventory Data Analyzer (IDA) format, which contains data fields for annual or average ozone season emissions data. A simple utility was written in FORTRAN to perform this conversion.

Also, seasonal and diurnal temporal profiles were created as necessary in order to apply the allocation factors recommended in earlier sections of this document. SMOKE cross-reference files were updated to access these new profiles for the appropriate source categories.

STI created all input files and scripts so that they are compatible with the most recent version of SMOKE (version 1.5), as we have been advised that CENRAP plans to use version 1.5 for its January and July 2002 modeling efforts.

5.3 DELIVERABLE FILES

The following files were delivered by STI upon completion of the ammonia emission inventory with accompanying documentation:

- Activity data files used as inputs to the CMU model
- Emission factor files used as inputs to the CMU model
- CMU output emission data files in latest NIF format
- Emission data files converted to IDA format and ready for input to SMOKE 1.5
- Temporal profile and cross-reference files for use by SMOKE
- Spatial surrogate and cross-reference files for use by SMOKE

BART Survey and Supplemental Information

November 11, 2004

Contact
Facility Name
Facility Street Address
Facility City, State, ZIP

Dear Contact:

I would like to request your assistance in gathering information needed about your facility related to the federal regional haze program. In 1999, the Environmental Protection Agency (EPA) issued regulations for the protection of visibility in our Natural Parks and Wilderness Areas (See http://www.epa.gov/ttn/oarpg/t1/fr_notices/rhfedreg.pdf). These regulations require states to establish goals for improving visibility by developing long-term strategies for reducing emissions of air pollutants that cause visibility impairment. The State of Missouri is working as a member of the Central States Regional Air Planning Association (CENRAP) to meet these requirements. CENRAP is an association of states, tribes, federal agencies, and other interested parties organized for the purpose of studying visibility impairment and of assisting individual states and tribes in preparing plans to address the problem. CENRAP includes the states and tribal areas of Minnesota, Nebraska, Iowa, Kansas, Missouri, Oklahoma, Arkansas, Texas, and Louisiana.

Missouri has been working jointly with these states and tribes to locate and operate air monitors, to develop and share emission inventories, and to conduct regional computer modeling to help identify potential strategies to reduce haze. Each state will use this information to develop individual state implementation plans (SIPs) to meet each states' obligation under the federal regulations. Missouri is required to submit a SIP to EPA by December 31, 2007. While three years seems like a long period of time, the state rulemaking timelines have grown to the point that we need to begin now to consider potential regulations in place by then. One of the first steps is to determine which air pollution units will be subject to the federal Best Available Retrofit Technology (BART) regulations.

BART applies to emission units in existence on August 7, 1977, that had begun operation after August 7, 1962, and that, individually or in combination with other such units, have the potential to emit 250 tons per year or more of any visibility-impairing pollutant. Having commenced construction on or before August 7, 1977, BART-eligible sources were in existence prior to the Prevention of Significant Deterioration (PSD) permitting requirements of the 1977 Clean Air Act Amendments.

Visibility impairing pollutants include: ammonia (NH_3), nitrogen oxides (NO_x), particulate matter less than ten microns (PM_{10}), sulfur dioxide (SOx), and volatile organic compounds (VOCs). Affected emission units must also fall into one of 26 source categories, including electric generating units, industrial boilers, and other large industrial operations. Attachment A is a list of the 26 source categories.

It is important that we ensure the accuracy of Missouri's final list of BART-eligible sources. To that end, we are asking for your participation in this process. We have queried our Emission Inventory Questionnaire (EIQ) database using the Standard Industrial Classification and Source Classification Codes to identify sources that correspond to the 26 BART source categories listed in Attachment A. We then attempted to eliminate sources that we knew had been constructed after August 7, 1977, and sources that have basic or intermediate Operating Permits (who therefore have facility-wide emissions of less than 100 tons per year). Certain units at your facility were not eliminated, so you are still on our list of potentially BART-eligible sources. Your assistance is needed to confirm our finding and help us further determine if your facility should remain on the list.

The enclosed questionnaire summarizes information related to your emission unit(s) and requests additional data. The questionnaire lists information for each unit of interest at your facility and includes blanks for you to insert the following information:

1) The "In existence date", or indication (yes/no) that the unit was in existence on August 7. 1977,
2) The "Began operation date", or indication (yes/no) that the unit began operation after August 7, 1962,
3&4) Confirmation of the industrial classification of your facility,
5) Potential emissions of the five pollutants (NH_3, NO_x, PM_{10}, SO_x, & VOCs),
6) Maximum heat input rate (million BTU/hr) if the unit is a fossil-fuel boiler,
7) Storage capacity (barrels) if the unit is a petroleum storage tank, and
8) Your conclusion summarizing your determination of whether your unit is BART-eligible or not.

In completing the questionnaire I ask that you follow the enclosed "Instructions for BART Information Request Form" for each unit, insert the requested information, and provide your own evaluation of whether you believe the unit falls within the construction time span that would identify your unit as a BART-eligible source. I also ask that you identify any additional

emission units at your facility that we have failed to identify, but that you believe meet the BART-eligible requirements.

Please complete the questionnaire and return it to the department at the following address:

Air Pollution Control Program
P.O. Box 176
Jefferson City, MO 65102
Attn: John Rustige, P.E.

To assist you in completing this questionnaire we have included definitions and guidance material in a Frequently Asked Questions (FAQs) attachment to this letter. The *Proposed Guidelines for Best Available Retrofit Technology (BART) Determinations Under the Regional Haze Regulations* is also available at EPA's website at http://www.epa.gov/ttn/oarpg/t1/fr_notices/bart6-21.pdf

How will this data be used?

This is just the initial step in determining BART sources. After Missouri has compiled a list of BART-eligible sources, there are several additional steps that have to be taken in the BART process. The following is a brief summary of those steps:

1) *Identification of sources subject to BART controls*. Sources subject to BART controls are those BART-eligible sources which "emit a pollutant which may reasonably be anticipated to cause or contribute to any impairment in any Class I area." This will require air pollution modeling studies to determine each individual sources' contribution to see what impact each source has on visibility in the Class I area.
2) *Engineering analysis*. For each source that is subject to BART controls an engineering analysis of emission control alternatives will be required. This process will be similar to the Best Available Control Technology (BACT) process that new major sources undergo during construction permit review. This step requires the identification of available, technically feasible, retrofit emission controls. For each technology identified, an analysis must be made of the cost of compliance, and the energy and non-air quality environmental impacts, taking into account the remaining useful life and existing control technology operated at the source. For each source, a "best system of continuous emission reduction" is selected based on this engineering analysis.
3) *Enforceable limits*. Considering the engineering analysis, states must establish enforceable emission limits, including a deadline for compliance, for each source subject to BART.

We appreciate your assistance in completing the questionnaire to assist us in determining if your facility is or is not subject to BART. Please respond even if you believe that your units do not

meet the BART-eligible criteria so that we can eliminate them from our list. We request that you return your questionnaire to us no later than December 17, 2004.

If you have any questions about the questionnaire, regional haze, or the BART process, please contact John Rustige at P.O. Box 176, Jefferson City, MO 65102 or by phone at (573) 751-4817. Thank you for your assistance.

Sincerely,
AIR POLLUTION CONTROL PROGRAM

Leanne Tippett Mosby

Attachment

Attachment A

Source Categories Eligible for BART:

1. Fossil-fuel fired steam electric plants of more than 250 million Btu/hr heat input
2. Coal cleaning plants (with thermal dryers)
3. Kraft pulp mills
4. Portland cement plants
5. Primary zinc smelters
6. Iron and steel mill plants
7. Primary aluminum ore reduction plants
8. Primary copper smelters
9. Municipal incinerators capable of charging more than 250 tons of refuse per day
10. Hydrofluoric, sulfuric, and nitric acid plants
11. Petroleum refineries
12. Lime plants
13. Phosphate rock processing plants
14. Coke oven batteries
15. Sulfur recovery plants
16. Carbon black plants (furnace plants)
17. Primary lead smelters
18. Fuel conversion plants
19. Sintering plants
20. Secondary metal production plants
21. Chemical process plants
22. Fossil-fuel boilers (or combinations thereof) totaling more than 250 million Btu/hr heat input
23. Petroleum storage and transfer facilities with a total storage capacity exceeding 300,000 barrels
24. Taconite ore processing facilities
25. Glass fiber processing plants
26. Charcoal production facilities.

Frequently Asked Questions (FAQ's)

Q. What is regional haze?

Haze obscures the clarity, color, texture, and form of what we see. Some haze-causing pollutants (mostly fine particles) are directly emitted to the atmosphere by a number of activities (such as electric power generation, various industrial and manufacturing processes, truck and auto emissions, burning related to forestry and agriculture, construction activities, etc.). Others are formed when gases emitted to the air form particles as they are carried downwind. Examples include sulfate, formed from sulfur dioxide, and nitrates, formed from nitrogen oxides. The Regional Haze Rule was issued by the Environmental Protection Agency (EPA) to improve visibility, or visual air quality, in 156 Class I areas across the country.

Q. What is a Class I area?

The Clean Air Act defines mandatory Class I Federal areas as certain national parks (over 6000 acres), wilderness areas (over 5000 acres), national memorial parks (over 5000 acres), and international parks that were in existence as of August 1977. There are currently 156 Class I areas listed in the United States. These areas include many of our best known and most treasured natural areas, such as the Grand Canyon, Mt. Rushmore, Yosemite, Yellowstone, Mount Rainier, Shenandoah, the Great Smokies, Acadia, and the Everglades. Two class I areas are located in Missouri. Hercules Glade Wilderness Area (12,300 acres) is located approximately 35 miles southeast of Springfield, Missouri and the Mingo Wilderness Area (7,700 acres) is located approximately 20 miles southwest of Poplar Bluff, Missouri.

Q. Why is Missouri actively participating with other Midwestern states in the regional haze planning efforts of the Central Regional Air Planning Association

Recent research has clearly shown that particulate matter and other haze producing precursors can generally span broad geographic areas and can be transported great distances, sometimes hundreds or thousands of miles. Consequently, haze occurs regionally throughout the nation. Pollutants produced in other states may affect Missouri's Class I areas, and Missouri sources may affect Class I areas located outside our borders. Also, by joining with other states, Missouri is able to share the planning and the rigorous and intensive computer modeling necessary to understand haze formation and its causes.

Q. What does BART stand for?

Best Available Retrofit Technology.

Q. What are the steps in identifying BART-eligible sources?

Step 1: Evaluate emission unit's construction/reconstruction dates.
Step 2: Verify BART category.

Step 3: Determine potential emissions.
Step 4: Provide additional information (boilers & storage tanks only).

Q. What does "in existence on August 7, 1977" mean?

The regulation defines "in existence" to mean that:
The owner or operator has obtained all necessary preconstruction approvals or permits required by Federal, State, or local air pollution emissions and air quality laws or regulations and either has (1) begun, or caused to begin, a continuous program of physical on-site construction of the facility or (2) entered into binding agreements or contractual obligations, which cannot be canceled or modified without substantial lose to the owner or operator, to undertake a program of construction of the facility to be completed in a reasonable time. See 40 CFR 51.301.

Example: The owner or operator obtained necessary permits in early 1977 and entered into binding construction agreements in June 1977. Actual on-site construction began in late 1978, and construction was completed in mid-1979. The source began operating in September of 1979. The emission unit was "in existence" as of August 7, 1977.

Q. What does "in operation before August 7, 1962" mean?

An emissions unit that meets the August 7, 1977 "in existence" test is not BART-eligible if it was in operation before August 7, 1962. "In operation" is defined as "engaged in activity related to the primary design function of the source." This means that a source must have begun actual operations by August 7, 1962 to satisfy this test.

Example: The owner or operator entered into binding agreements in 1960. Actual on-site construction began in 1961, and construction was completed in mid-1962. The source began operating in September of 1962. The emissions unit was not "in operation" before August 7, 1962 and is therefore subject to BART.

Q. What is a "reconstructed source?"

Under a number of CAA programs, an existing source which is completely or substantially rebuilt is treated as a new source. Such "reconstructed" sources are treated as new sources as of the time of the reconstruction. Consistent with this overall approach to reconstructions, the definition of BART-eligible facility (reflected in detail in the definition of "existing stationary facility") includes consideration of sources that were in operation before August 7, 1962, but were reconstructed during the August 7, 1962 to August 7, 1977 time period. Under the regulation, a reconstruction has taken place if "the fixed capital cost of the new component exceeds 50 percent of the fixed capital cost of a comparable entirely new source." The rule also states that "Any final decision as to whether reconstruction has occurred must be made in accordance with the provisions of Secs. 60.15 (f)(1) through (3) of this title." [40 CFR 51.301] "Secs. 60.15(f)(1) through (3)" refer to the general provisions for New Source Performance Standards (NSPS). Thus, the same policies and procedures for identifying reconstructed "affected facilities" under the NSPS program must also be used to identify

reconstructed "stationary sources" for purposes of the BART requirement. You should identify reconstructions on an emissions unit basis, rather than on a plantwide basis. That is, you need to identify only the reconstructed emission units meeting the 50 percent cost criterion. You should include reconstructed emission units in the list of emission units you identified in Step 1. The "in operation" and "in existence" tests apply to reconstructed sources. If an emissions unit was reconstructed and began actual operation before August 7, 1962, it is not BART-eligible. Similarly, any emissions unit for which a reconstruction "commenced" after August 7, 1977, is not BART-eligible.

Q. How are modifications treated under the BART provision?

In general, the term "modification" refers to any physical change or change in the method of operation of an emissions unit that leads to an increase in emissions. The EPA believes that the best interpretation for purposes of the visibility provisions is that modified emissions units are still "existing". The BART requirements in the CAA do not appear to provide any exemption for sources which were modified since 1977. Accordingly, if an emissions unit began operation before 1962, it is not BART-eligible if it is modified at a later date, so long as the modification is not also a "reconstruction." Similarly, an emissions unit which began operation within the 1962-1977 time window, but was modified after August 7, 1977, is BART-eligible.

Q. What pollutants should I address?

Visibility-impairing pollutants include the following:

1. Sulfur oxides (SO_x),
2. Nitrogen oxides (NO_X),
3. Particulate matter. (Please use PM_{10} as the indicator for particulate matter. PM_{10} emissions include the components of $PM_{2.5}$ as a subset. There is no need to have separate 250 ton thresholds for PM_{10} and $PM_{2.5}$, because 250 tons of PM_{10} represents at most 250 tons of $PM_{2.5}$, and at most 250 tons of any individual particulate species such as elemental carbon, crystal material, etc).
4. Volatile organic compounds (VOC), and
5. Ammonia (NH_3).

Q. What does the term "potential" emissions mean?

The regional haze rule defines potential to emit as follows:
"Potential to emit" means the maximum capacity of a stationary source to emit a pollutant under its physical and operational design. Any physical or operational limitation on the capacity of the source to emit a pollutant including air pollution control equipment and restrictions on hours of operation or on the type or amount of material combusted, stored, or processed, shall be treated as part of its design if the limitation or the effect it would have on emissions is federally enforceable. Secondary emissions do not count in determining the potential to emit of a stationary source.

Q. How do I calculate "potential emissions?"

Your facility may have already gone through the potential to emit calculations when applying for your operating permit. Please refer to the potential to emit calculations performed for your operating permit. Potential emissions are the emission rates of any pollutant at maximum design capacity. Annual potential shall be based on the maximum annual rated capacity of the installation assuming continuous year-round, around-the-clock operation. Federally enforceable permit conditions on the type of material combusted or processed, operating rates, hours of operation or the application of air pollution control equipment shall be used in determining the annual potential. Secondary emissions (emissions which occur or would occur as a result of the construction or operation of the installation or major modification but do not come from the installation or modification itself) do not count in determining annual potential.

Q. How do I determine the BART category status of steam electric plants?

"Steam electric plants of more than 250 million BTU/hr heat input." Because the category refers to "plants," boiler capacities must be aggregated to determine whether the 250 million BTU/hr threshold is reached.

Example: A stationary source includes a steam electric plant with three 100 million BTU/hr boilers. Because the aggregate capacity exceeds 250 million BTU/hr for the "plant," these boilers would be identified as BART-eligible.

Q. How do I determine the BART category status of fossil-fuel boilers?

"Fossil-fuel boilers of more than 250 million BTU/hr heat input." The EPA has proposed two options for interpreting this source category title. The first option would be to aggregate all boiler capacities to determine whether the 250 million BTU/hr threshold is reached. Under the second option, this category would be interpreted to cover only those boilers that are individually greater than 250 million BTU/hr. Until the rule and guidance is finalized, Missouri is collecting information assuming that all boiler capacities will need to be aggregated. If EPA decides to make BART applicable to boilers that are individually greater than 250 million BTU/hr, the surveys collected will provide the information needed to exempt the appropriate units.

Q. How do I determine the BART category status of petroleum storage and transfer facilities with a capacity exceeding 300,000 barrels?

The 300,000 barrel cutoff refers to the total facility wide tank capacity for tanks that were put in place within the 1962-1977 time period, and includes gasoline and other petroleum derived liquids.

Additional Definitions and Guidance

Stationary source means all of the pollutant emitting activities which belong to the same industrial grouping (i.e., have the same two-digit SIC code), are located on one or more contiguous or adjacent properties, and are under the control of the same person (or persons under common control). [40CFR51.301].

In existence means that the owner or operator has obtained all necessary preconstruction approvals or permits required by Federal, State, or local air pollution emissions and air quality laws or regulations and either has (1) begun, or caused to begin, a continuous program of physical on-site construction of the facility or (2) entered into binding agreements or contractual obligations, which cannot be cancelled or modified without substantial loss to the owner or operator, to undertake a program of construction of the facility to be completed in a reasonable time [40CFR51.301]. The potential emissions of all emission units falling within the 15-year BART window and within any of the 26 source categories (they don't all have to be in the same category) must be aggregated for comparison to the 250-ton/year threshold. For the two source categories, fossil fuel fired steam electric plants of 250 million Btu/hr heat input and fossil fuel boilers (or combinations thereof) totaling more than 250 million Btu/hr heat input, the proposed rule (subject to change) requires that the maximum heat input rates of all individual emission units falling within the BART window first be aggregated for comparison to the 250-million Btu/hr threshold. For petroleum storage and transfer facilities, the capacities of all storage tanks falling within the BART window must first be aggregated for comparison to the 300,000-barrel threshold. The total potential emissions of these such units or tanks, along with all other emission units falling within the BART window and within any of the 26 source categories, must then be compared to the 250-ton/year threshold to determine BART eligibility. Note, in the final rule EPA may choose not to aggregate boilers on the basis of heat input rate but, instead, apply the 250-million Btu/hr threshold to individual fossil-fuel boilers. Therefore, all boilers should be listed individually for purposes of this preliminary assessment.

Note: The BART requirements are a core component of the federal regional haze program and are likely to provide the primary basis for implementing substantial pollution reductions to advance visibility goals over the next decade. The BART requirements were outlined in the Clean Air Act Amendments of 1977 and subsequently updated in the regional haze rule of 1999 and in more recent guidance published on July 20, 2001 (Federal Register [66 Fed. Reg., 38108 (July20,2001)] as a proposed rule.

INSTRUCTIONS FOR BART INFORMATION REQUEST FORM

Work through these steps sequentially for each emissions unit (EU) listed on each form. If we have missed any EUs that meet the BART criteria, please add them to the blank form. Make copies of the blank form as needed.

STEP A. "Dates": Evaluate EU construction/reconstruction dates.

1. Enter "yes" if EU was in existence on August 7, 1977; otherwise enter "no."

2. Enter "yes" if EU began operation after August 7, 1962; otherwise enter "no."

If 1. and 2. are both "yes", move to Step B.

If 1a and 1b are "yes" and "no" or "no and "yes,"respectively, skip Steps B through D for this EU, move to Step E and complete the form by answering "no, outside date range" to question 8.

STEP B. "BART Category": Verify BART category.

3. This question contains a number corresponding to the list of BART categories from Attachment A. Review this number and determine whether it is appropriate for this EU, and enter "yes" or "no" as appropriate. If you answered "yes", continue to Step C.

4. If you answered "no" in number 3, please enter the correct number corresponding to the BART categories listed on <u>Attachment A</u> and continue to Step C. If this EU doesn't fall within one of the 26 BART categories, enter "none". If you entered "none" skip Steps C and D for this EU, move to Step E and complete the form by answering "no, source is not a BART category" to question 8.

STEP C. "Emissions": Enter potential emissions.

5. The actual emissions that you reported to us for calendar year 2002 for each emission unit are summed and provided in table form. Ammonia (NH4) emissions have not been included because Missouri facilities were not required to report ammonia emissions in 2002. If you see any errors, please bring them to our attention, by noting this on the form.

   Enter the current potential emissions for each pollutant for this unit in tons/year. Enter "0" if your potential emissions for that pollutant is "0". You may have conducted this calculation when preparing your operating permit, and it is suggested that you use these figures when or if they are available.

   Potential emissions for this unit shall be calculated in a manner similar to how actual emissions are calculated for your annual EIQ, except that your emissions must be calculated based on the maximum annual-rated capacity of the installation, assuming

continuous year-round around-the-clock operation. Federally enforceable permit conditions limiting the type of materials combusted, or processed, operating rates, hours of operation or the application of air pollution control equipment shall be used in determining the annual potential.

A federally enforceable condition is any limitation or condition that is enforceable by the EPA Administrator. It includes all New Source Performance Standards (NSPS), National Emission Standards for Hazardous Air Pollutants (NESHAPs), and Hazardous Air Pollutant (HAP) requirements, requirements within the state implementation plan (SIP), any Prevention of Significant Deterioration (PSD) or non-attainment review permits, and any existing construction or operating permits.

Since the construction permit rule is approved by the EPA as part of the Missouri SIP, construction or operating permit limitations are federally enforceable and should be considered in your calculations. These limits can take the form of limits on emissions, production, or even other operational limitations.

In calculating potential emissions, the installation may also consider “inherent physical limitations” in potential to emit calculations. In other words, emissions which are constrained by process limitations external to the unit rather than “maximum capacity” of the unit are process bottlenecks and are considered as a “physical limitations” when calculating potential to emit.

If this EU includes fossil-fuel boilers or petroleum storage tanks, move on to Step D. Otherwise, skip Step D and move to Step E.

STEP D. Additional information (boilers & storage tanks only):

6. Enter the maximum heat input capacity of the boiler in million British thermal units per hour (MMBtu/hr). If there are multiple boilers within this EU, enter the sum of the heat input capacities for all boilers put in place within the 1962-1977 time period. Continue to Step E.

7. Enter the capacity of the petroleum storage tank in barrels. If there are multiple tanks within this EU, enter the sum of the capacities for all tanks put in place within the 1962-1977. Continue to Step E.

STEP E. “Conclusion”: Provide conclusion or notes about this EU.

8. If you have already entered a “no” answer to this question already, then continue with Step A on the next form for your facility (if any).

   If your potential emissions is below 250 tons per year for each individual pollutant enter “No. PTE<250 for each individual pollutant for this EU”, then continue with Step A on the next form for your facility (if any).

If your potential emissions is above 250 tons per year for any one or more pollutants enter “yes”. By entering yes you are determining that this unit will be preliminarily classified as “BART-eligible” and staff will be further reviewing this preliminary determination. Please continue with Step A on the next form for your facility (if any).

This question also provides a few lines for you to add any comments or a brief explanation that might help staff understand your conclusion about whether this unit is or is not “BART-eligible”.

NOTE: *The 250 ton per year threshold applies to the* <u>*sum*</u> *of emissions from all units at the facility that meet the construction/reconstruction date test and the BART category test. If you have multiple units at your facility that meet these tests, staff will use the figures reported on this questionnaire and sum each pollutant to determine the overall potential of each pollutant at your facility.*

Please sign and date the forms and return to the following address no later than December 17, 2004.

Missouri Department of Natural Resources

NOV 1 2 2007

Mr. Aaron Miller
Doe Run Company
881 Main Street
Herculaneum, MO 63048

RE: Control Requirements and Permit Status
Doe Run – Glover Plant

Dear Mr. Miller:

As we understand, your facility is in care/maintenance status and it is unlikely you will operate anytime in the near future. Currently no smelter operations or production of refined lead is occurring and the only activity at the facility is rail transfer that occurs about twice per week. The facility has been allowed to suspend all State Implementation Plans (SIP) and Maximum Achievable Control Technology (MACT) required compliance testing and reporting requirements until the facility resumes operations. Doe Run – Glover is still required to conduct air monitoring at several locations and maintains those records electronically. In addition, your operating permit application has been on hold for an extended period of time. Our goal is to better understand the plans for your operation at Glover and detail those in the operating permit for this facility.

If operations commence to produce refined lead, Doe Run - Glover will be subject to additional federal requirements beyond the current lead SIP. These include a detailed Best Available Retrofit Technology (BART) evaluation and potential additional control under the federal regional haze rule. Also, Doe Run Glover might be subject to control requirements for the St. Louis $PM_{2.5}$ SIP that is currently under development.

According to the U.S. Environmental Protection Agency's (EPA) final rule published on July 6, 2005, BART applies only to a major stationary source which "was in existence on August 7, 1977, but which has not been in operation for more than 15 years as of such date". Based on survey data submitted by Doe Run and a cursory review of Emission Inventory Questionnaire/construction permit data, the blast furnace and sinter plant were designated as BART-eligible.

Mr. Aaron Miller
Page Two

According to 10 CSR 10-6.060 (1)(C), no owner or operator shall begin operation of any installation, which has been shut down for longer than five years without obtaining a permit from the permitting authority. Therefore, if each individual emission unit is not operated within five years of its last operation (currently understood to be in 2003) without clear indication of intent to operate by having an operating permit, new construction permits must be acquired from the Missouri Department of Natural Resources' Air Pollution Control Program before you commence operation.

We intend to issue your operating permit or terminate your application. To accomplish this, please confirm the last operating date of each major process unit and the future plans for each unit at Glover. Please provide this information within 30 days of receipt of this letter. If you request termination, or we do not hear from you at the end of that time, we will terminate your operating permit application.

If you have any questions regarding permit issues, please contact me. Questions regarding BART, regional haze, or the St. Louis $PM_{2.5}$ SIP should be directed to Mr. Jeff Bennett or Mr. John Rustige. All contacts may be reached at (573) 751-4817. Thank you for your time and attention.

Sincerely,

AIR POLLUTION CONTROL PROGRAM

Michael Stansfield

INPUT GROUP: 1 -- General run control parameters

Option to run all periods found
in the met. file (METRUN) Default: 0 ! METRUN = 0 !

METRUN = 0 - Run period explicitly defined below
METRUN = 1 - Run all periods in met. file

```
Starting date:   Year (IBYR) -- No default       ! IBYR =  2002 !
(used only if   Month (IBMO) -- No default       ! IBMO =   3 !
 METRUN = 0)      Day (IBDY) -- No default       ! IBDY =   27 !
                 Hour (IBHR) -- No default       ! IBHR =   0 !

Base time zone        (XBTZ) -- No default       ! XBTZ = 0.0  !
  PST = 8., MST = 7.
  CST = 6., EST = 5.

Length of run (hours) (IRLG) -- No default       ! IRLG =  2280 !

Number of chemical species (NSPEC)
                         Default: 5       ! NSPEC =  6   !

Number of chemical species
to be emitted  (NSE)           Default: 3       ! NSE =  3   !

Flag to stop run after
SETUP phase (ITEST)            Default: 2       ! ITEST =  2   !
(Used to allow checking
of the model inputs, files, etc.)
     ITEST = 1 - STOPS program after SETUP phase
     ITEST = 2 - Continues with execution of program
              after SETUP

Restart Configuration:

  Control flag (MRESTART)      Default: 0       ! MRESTART =  0   !

     0 = Do not read or write a restart file
     1 = Read a restart file at the beginning of
        the run
     2 = Write a restart file during run
     3 = Read a restart file at beginning of run
        and write a restart file during run

  Number of periods in Restart
  output cycle (NRESPD)       Default: 0       ! NRESPD =  0   !

     0 = File written only at last period
    >0 = File updated every NRESPD periods

Meteorological Data Format (METFM)
                         Default: 1       ! METFM =  1   !

     METFM = 1 - CALMET binary file (CALMET.MET)
     METFM = 2 - ISC ASCII file (ISCMET.MET)
     METFM = 3 - AUSPLUME ASCII file (PLMMET.MET)
     METFM = 4 - CTDM plus tower file (PROFILE.DAT) and
              surface parameters file (SURFACE.DAT)

Meteorological Profile Data Format (MPRFFM)
       (used only for METFM = 1, 2, 3)
                         Default: 1       ! MPRFFM =  1   !

     MPRFFM = 1 - CTDM plus tower file (PROFILE.DAT)
```

MPRFFM = 2 - AERMET tower file (PROFILE.DAT)

PG sigma-y is adjusted by the factor (AVET/PGTIME)**0.2
Averaging Time (minutes) (AVET)
Default: 60.0 ! AVET = 60. !
PG Averaging Time (minutes) (PGTIME)
Default: 60.0 ! PGTIME = 60. !

!END!

INPUT GROUP: 2 -- Technical options

Vertical distribution used in the
near field (MGAUSS) Default: 1 ! MGAUSS = 1 !
0 = uniform
1 = Gaussian

Terrain adjustment method
(MCTADJ) Default: 3 ! MCTADJ = 3 !
0 = no adjustment
1 = ISC-type of terrain adjustment
2 = simple, CALPUFF-type of terrain
adjustment
3 = partial plume path adjustment

Subgrid-scale complex terrain
flag (MCTSG) Default: 0 ! MCTSG = 0 !
0 = not modeled
1 = modeled

Near-field puffs modeled as
elongated 0 (MSLUG) Default: 0 ! MSLUG = 0 !
0 = no
1 = yes (slug model used)

Transitional plume rise modeled ?
(MTRANS) Default: 1 ! MTRANS = 1 !
0 = no (i.e., final rise only)
1 = yes (i.e., transitional rise computed)

Stack tip downwash? (MTIP) Default: 1 ! MTIP = 1 !
0 = no (i.e., no stack tip downwash)
1 = yes (i.e., use stack tip downwash)

Method used to simulate building
downwash? (MBDW) Default: 1 ! MBDW = 1 !
1 = ISC method
2 = PRIME method

Vertical wind shear modeled above

stack top? (MSHEAR) Default: 0 ! MSHEAR = 0 !
  0 = no (i.e., vertical wind shear not modeled)
  1 = yes (i.e., vertical wind shear modeled)

Puff splitting allowed? (MSPLIT) Default: 0 ! MSPLIT = 0 !
  0 = no (i.e., puffs not split)
  1 = yes (i.e., puffs are split)

Chemical mechanism flag (MCHEM) Default: 1 ! MCHEM = 1 !
  0 = chemical transformation not
     modeled
  1 = transformation rates computed
     internally (MESOPUFF II scheme)
  2 = user-specified transformation
     rates used
  3 = transformation rates computed
     internally (RIVAD/ARM3 scheme)
  4 = secondary organic aerosol formation
     computed (MESOPUFF II scheme for OH)

Aqueous phase transformation flag (MAQCHEM)
(Used only if MCHEM = 1, or 3) Default: 0 ! MAQCHEM = 0 !
  0 = aqueous phase transformation

     not modeled
  1 = transformation rates adjusted
     for aqueous phase reactions

Wet removal modeled ? (MWET) Default: 1 ! MWET = 1 !
  0 = no
  1 = yes

Dry deposition modeled ? (MDRY) Default: 1 ! MDRY = 1 !
  0 = no
  1 = yes
  (dry deposition method specified
   for each species in Input Group 3)

Method used to compute dispersion
coefficients (MDISP) Default: 3 ! MDISP = 3 !

  1 = dispersion coefficients computed from measured values
     of turbulence, sigma v, sigma w
  2 = dispersion coefficients from internally calculated
     sigma v, sigma w using micrometeorological variables
     (u*, w*, L, etc.)
  3 = PG dispersion coefficients for RURAL areas (computed using
     the ISCST multi-segment approximation) and MP coefficients in
     urban areas
  4 = same as 3 except PG coefficients computed using
     the MESOPUFF II eqns.
  5 = CTDM sigmas used for stable and neutral conditions.
     For unstable conditions, sigmas are computed as in
     MDISP = 3, described above. MDISP = 5 assumes that
     measured values are read

Sigma-v/sigma-theta, sigma-w measurements used? (MTURBVW)
(Used only if MDISP = 1 or 5)   Default: 3   ! MTURBVW = 3 !
  1 = use sigma-v or sigma-theta measurements
      from PROFILE.DAT to compute sigma-y
      (valid for METFM = 1, 2, 3, 4)
  2 = use sigma-w measurements
      from PROFILE.DAT to compute sigma-z
      (valid for METFM = 1, 2, 3, 4)
  3 = use both sigma-(v/theta) and sigma-w
      from PROFILE.DAT to compute sigma-y and sigma-z
      (valid for METFM = 1, 2, 3, 4)
  4 = use sigma-theta measurements
      from PLMMET.DAT to compute sigma-y
      (valid only if METFM = 3)

Back-up method used to compute dispersion
when measured turbulence data are
missing (MDISP2)   Default: 3   ! MDISP2 = 3 !
(used only if MDISP = 1 or 5)
  2 = dispersion coefficients from internally calculated
      sigma v, sigma w using micrometeorological variables
      (u*, w*, L, etc.)
  3 = PG dispersion coefficients for RURAL areas (computed using
      the ISCST multi-segment approximation) and MP coefficients in
      urban areas
  4 = same as 3 except PG coefficients computed using
      the MESOPUFF II eqns.

[DIAGNOSTIC FEATURE]
Method used for Lagrangian timescale for Sigma-y
(used only if MDISP=1,2 or MDISP2=1,2)
(MTAULY)   Default: 0   ! MTAULY = 0 !
  0 = Draxler default 617.284 (s)
  1 = Computed as Lag. Length / (.75 q) -- after SCIPUFF
  10 < Direct user input (s)   -- e.g., 306.9

[DIAGNOSTIC FEATURE]
Method used for Advective-Decay timescale for Turbulence
(used only if MDISP=2 or MDISP2=2)
(MTAUADV)   Default: 0   ! MTAUADV = 0 !
  0 = No turbulence advection
  1 = Computed (OPTION NOT IMPLEMENTED)
  10 < Direct user input (s)   -- e.g., 300

Method used to compute turbulence sigma-v &
sigma-w using micrometeorological variables
(Used only if MDISP = 2 or MDISP2 = 2)
(MCTURB)   Default: 1   ! MCTURB = 1 !
  1 = Standard CALPUFF subroutines
  2 = AERMOD subroutines

PG sigma-y,z adj. for roughness?   Default: 0   ! MROUGH = 0 !
(MROUGH)
  0 = no

1 = yes

Partial plume penetration of elevated inversion? (MPARTL)   Default: 1   ! MPARTL = 1 !
0 = no
1 = yes

Strength of temperature inversion provided in PROFILE.DAT extended records? (MTINV)   Default: 0   ! MTINV = 0 !
0 = no (computed from measured/default gradients)
1 = yes

PDF used for dispersion under convective conditions? (MPDF)   Default: 0   ! MPDF = 0 !
0 = no
1 = yes

Sub-Grid TIBL module used for shore line? (MSGTIBL)   Default: 0   ! MSGTIBL = 0 !
0 = no
1 = yes

Boundary conditions (concentration) modeled? (MBCON)   Default: 0   ! MBCON = 0 !
0 = no
1 = yes, using formatted BCON.DAT file
2 = yes, using unformatted CONC.DAT file

Analyses of fogging and icing impacts due to emissions from arrays of mechanically-forced cooling towers can be performed using CALPUFF in conjunction with a cooling tower emissions processor (CTEMISS) and its associated postprocessors. Hourly emissions of water vapor and temperature from each cooling tower cell are computed for the current cell configuration and ambient conditions by CTEMISS. CALPUFF models the dispersion of these emissions and provides cloud information in a specialized format for further analysis. Output to FOG.DAT is provided in either 'plume mode' or 'receptor mode' format.

Configure for FOG Model output? (MFOG)   Default: 0   ! MFOG = 0 !
0 = no
1 = yes - report results in PLUME Mode format
2 = yes - report results in RECEPTOR Mode format

Test options specified to see if they conform to regulatory values? (MREG)   Default: 1   ! MREG = 1 !

```
        0 = NO checks are made
        1 = Technical options must conform to USEPA

Subgroup (3b)

The following names are used for Species-Groups in which results for certain species are combined (added) prior to output. The CGRUP name will be used as the species name in output files. Use this feature to model specific particle-size distributions by treating each size-range as a separate species. Order must be consistent with 3(a) above.

INPUT GROUP: 4 -- Map Projection and Grid control parameters

Projection for all (X,Y):

Map projection
(PMAP) Default: UTM ! PMAP = LCC !

UTM : Universal Transverse Mercator
TTM : Tangential Transverse Mercator
LCC : Lambert Conformal Conic
PS : Polar Stereographic
EM : Equatorial Mercator
LAZA : Lambert Azimuthal Equal Area

False Easting and Northing (km) at the projection origin
(Used only if PMAP= TTM, LCC, or LAZA)
(FEAST) Default=0.0 ! FEAST = 0.000 !
(FNORTH) Default=0.0 ! FNORTH = 0.000 !

UTM zone (1 to 60)
(Used only if PMAP=UTM)
(IUTMZN) No Default ! IUTMZN = 15 !

Hemisphere for UTM projection?
(Used only if PMAP=UTM)
(UTMHEM) Default: N ! UTMHEM = N !
N : Northern hemisphere projection
S : Southern hemisphere projection

Latitude and Longitude (decimal degrees) of projection origin
(Used only if PMAP= TTM, LCC, PS, EM, or LAZA)
(RLAT0) No Default ! RLAT0 = 40N !
(RLON0) No Default ! RLON0 = 97W !

TTM : RLON0 identifies central (true N/S) meridian of projection
RLAT0 selected for convenience
LCC : RLON0 identifies central (true N/S) meridian of projection

RLAT0 selected for convenience
PS : RLON0 identifies central (grid N/S) meridian of projection
RLAT0 selected for convenience
EM : RLON0 identifies central meridian of projection
RLAT0 is REPLACED by 0.0N (Equator)
LAZA: RLON0 identifies longitude of tangent-point of mapping plane
RLAT0 identifies latitude of tangent-point of mapping plane

Matching parallel(s) of latitude (decimal degrees) for projection
(Used only if PMAP= LCC or PS)
(XLAT1) No Default ! XLAT1 = 33N !
(XLAT2) No Default ! XLAT2 = 45N !

LCC : Projection cone slices through Earth's surface at XLAT1 and XLAT2
PS : Projection plane slices through Earth at XLAT1
(XLAT2 is not used)

Note: Latitudes and longitudes should be positive, and include a
letter N,S,E, or W indicating north or south latitude, and
east or west longitude. For example,
35.9 N Latitude = 35.9N
118.7 E Longitude = 118.7E

Datum-region

The Datum-Region for the coordinates is identified by a character string. Many mapping products currently available use the model of the Earth known as the World Geodetic System 1984 (WGS-G). Other local models may be in use, and their selection in CALMET will make its output consistent with local mapping products. The list of Datum-Regions with official transformation parameters is provided by the National Imagery and Mapping Agency (NIMA).

NIMA Datum - Regions(Examples)

WGS-G WGS-84 GRS 80 Spheroid, Global coverage (WGS84)
NAS-C NORTH AMERICAN 1927 Clarke 1866 Spheroid, MEAN FOR CONUS (NAD27)
NWS-27 NWS 6370KM Radius, Sphere
NWS-84 NWS 6370KM Radius, Sphere
ESR-S ESRI REFERENCE 6371KM Radius, Sphere

Datum-region for output coordinates
(DATUM) Default: WGS-G ! DATUM = WGS-G !

METEOROLOGICAL Grid:

Rectangular grid defined for projection PMAP,
with X the Easting and Y the Northing coordinate

No. X grid cells (NX) No default ! NX = 366 !
No. Y grid cells (NY) No default ! NY = 234 !
No. vertical layers (NZ) No default ! NZ = 10 !

Grid spacing (DGRIDKM) No default ! DGRIDKM = 6 !
Units: km

Cell face heights
(ZFACE(nz+1)) No defaults
Units: m
! ZFACE = 0., 20., 40., 80., 160., 320., 640., 1200., 2000., 3000.,

Reference Coordinates
of SOUTHWEST corner of
grid cell(1, 1):

X-coordinate (XORIGKM) No default ! XORIGKM = -1008. !
Y coordinate (YORIGKM) No default ! YORIGKM = -864. !
Units: km

COMPUTATIONAL Grid:

The computational grid is identical to or a subset of the MET. grid.
The lower left (LL) corner of the computational grid is at grid point
(IBCOMP, JBCOMP) of the MET. grid. The upper right (UR) corner of the
computational grid is at grid point (IECOMP, JECOMP) of the MET. grid.
The grid spacing of the computational grid is the same as the MET. grid.

X index of LL corner (IBCOMP) No default ! IBCOMP = 200 !
(1 <= IBCOMP <= NX)

Y index of LL corner (JBCOMP) No default ! JBCOMP = 50 !
(1 <= JBCOMP <= NY)

X index of UR corner (IECOMP) No default ! IECOMP = 320 !
(1 <= IECOMP <= NX)

Y index of UR corner (JECOMP) No default ! JECOMP = 160 !
(1 <= JECOMP <= NY)

SAMPLING Grid (GRIDDED RECEPTORS):

The lower left (LL) corner of the sampling grid is at grid point
(IBSAMP, JBSAMP) of the MET. grid. The upper right (UR) corner of the
sampling grid is at grid point (IESAMP, JESAMP) of the MET. grid.
The sampling grid must be identical to or a subset of the computational
grid. It may be a nested grid inside the computational grid.
The grid spacing of the sampling grid is DGRIDKM/MESHDN.

Logical flag indicating if gridded
receptors are used (LSAMP) Default: T ! LSAMP = F !
(T=yes, F=no)

X index of LL corner (IBSAMP) No default ! IBSAMP = 1 !
(IBCOMP <= IBSAMP <= IECOMP)

Y index of LL corner (JBSAMP)   No default   ! JBSAMP = 1   !
(JBCOMP <= JBSAMP <= JECOMP)

X index of UR corner (IESAMP)   No default   ! IESAMP = 251   !
(IBCOMP <= IESAMP <= IECOMP)

Y index of UR corner (JESAMP)   No default   ! JESAMP = 246   !
(JBCOMP <= JESAMP <= JECOMP)

Nesting factor of the sampling
grid (MESHDN)   Default: 1   ! MESHDN = 1 !
(MESHDN is an integer >= 1)

-------------------------------------------------------------------------------

INPUT GROUP: 8 -- Size parameters for dry deposition of particles
--------------

    For SINGLE SPECIES, the mean and standard deviation are used to
    compute a deposition velocity for NINT (see group 9) size-ranges,
    and these are then averaged to obtain a mean deposition velocity.

    For GROUPED SPECIES, the size distribution should be explicitly
    specified (by the 'species' in the group), and the standard deviation
    for each should be entered as 0.  The model will then use the
    deposition velocity for the stated mean diameter.

    conditions (k1 in Eqn. 2.7-3)  (CONK1)     Default: 0.01   ! CONK1 = .01 !

    Vertical dispersion constant for neutral/
    unstable conditions (k2 in Eqn. 2.7-4)
    (CONK2)                                    Default: 0.1    ! CONK2 = .1 !

    Factor for determining Transition-point from
    Schulman-Scire to Huber-Snyder Building Downwash
    scheme (SS used for Hs < Hb + TBD * HL)
    (TBD)                                      Default: 0.5    ! TBD = .5 !
      TBD < 0   ==> always use Huber-Snyder
      TBD = 1.5 ==> always use Schulman-Scire
      TBD = 0.5 ==> ISC Transition-point

    Range of land use categories for which
    urban dispersion is assumed
    (IURB1, IURB2)                             Default: 10     ! IURB1 =  10  !
                                               19     ! IURB2 =  19  !

    Site characterization parameters for single-point Met data files ---------
    (needed for METFM = 2,3,4)

      Land use category for modeling domain
      (ILANDUIN)                               Default: 20     ! ILANDUIN =  20  !

      Roughness length (m) for modeling domain
      (Z0IN)                                   Default: 0.25   ! Z0IN = .25 !

      Leaf area index for modeling domain
      (XLAIIN)                                 Default: 3.0    ! XLAIIN = 3.0 !
```

Elevation above sea level (m)
(ELEVIN) Default: 0.0 ! ELEVIN = .0 !

Latitude (degrees) for met location
(XLATIN) Default: -999. ! XLATIN = -999.0 !

Longitude (degrees) for met location
(XLONIN) Default: -999. ! XLONIN = -999.0 !

Specialized information for interpreting single-point Met data files -----

Anemometer height (m) (Used only if METFM = 2,3)
(ANEMHT) Default: 10. ! ANEMHT = 10.0 !

Form of lateral turbulance data in PROFILE.DAT file
(Used only if METFM = 4 or MTURBVW = 1 or 3)
(ISIGMAV) Default: 1 ! ISIGMAV = 1 !
0 = read sigma-theta
1 = read sigma-v

Choice of mixing heights (Used only if METFM = 4)
(IMIXCTDM) Default: 0 ! IMIXCTDM = 0 !
0 = read PREDICTED mixing heights
1 = read OBSERVED mixing heights

Maximum length of a slug (met. grid units)
(XMXLEN) Default: 1.0 ! XMXLEN = 1.0 !

Maximum travel distance of a puff/slug (in
grid units) during one sampling step
(XSAMLEN) Default: 1.0 ! XSAMLEN = 1.0 !

Maximum Number of slugs/puffs release from
one source during one time step
(MXNEW) Default: 99 ! MXNEW = 99 !

Maximum Number of sampling steps for
one puff/slug during one time step
(MXSAM) Default: 99 ! MXSAM = 99 !

Number of iterations used when computing
the transport wind for a sampling step
that includes gradual rise (for CALMET
and PROFILE winds)
(NCOUNT) Default: 2 ! NCOUNT = 2 !

Minimum sigma y for a new puff/slug (m)
(SYMIN) Default: 1.0 ! SYMIN = 1.0 !

Minimum sigma z for a new puff/slug (m)
(SZMIN) Default: 1.0 ! SZMIN = 1.0 !

Default minimum turbulence velocities sigma-v and sigma-w
for each stability class over land and over water (m/s)
(SVMIN(12) and SWMIN(12))

```
            ----------  LAND  ----------        ---------  WATER  ----------

                        !  PPC = 0.50, 0.50, 0.50, 0.50, 0.35, 0.35 !

Slug-to-puff transition criterion factor
equal to sigma-y/length of slug
(SL2PF)                  Default: 10.       ! SL2PF = 10.0 !

Puff-splitting control variables ------------------------

 VERTICAL SPLIT
 --------------

 Number of puffs that result every time a puff
 is split - nsplit=2 means that 1 puff splits
 into 2
 (NSPLIT)                Default:   3       ! NSPLIT =  3  !

 Time(s) of a day when split puffs are eligible to
 be split once again; this is typically set once
 per day, around sunset before nocturnal shear develops.
 24 values: 0 is midnight (00:00) and 23 is 11 PM (23:00)
 0=do not re-split    1=eligible for re-split
 (IRESPLIT(24))              Default:  Hour 17 = 1
 !  IRESPLIT = 0,0,0,0,0,0,0,0,0,0,0,0,0,0,0,0,0,1,0,0,0,0,0,0 !

 Split is allowed only if last hour's mixing
 height (m) exceeds a minimum value
 (ZISPLIT)               Default: 100.      ! ZISPLIT = 100.0 !

 Split is allowed only if ratio of last hour's
 mixing ht to the maximum mixing ht experienced
 by the puff is less than a maximum value (this
 postpones a split until a nocturnal layer develops)
 (ROLDMAX)                   Default: 0.25      ! ROLDMAX = 0.25 !

 HORIZONTAL SPLIT
 ----------------

 Number of puffs that result every time a puff
 is split - nsplith=5 means that 1 puff splits
 into 5
 (NSPLITH)               Default:   5       ! NSPLITH =  5  !

 Minimum sigma-y (Grid Cells Units) of puff
 before it may be split
 (SYSPLITH)               Default:  1.0      ! SYSPLITH = 1.0 !

 Minimum puff elongation rate (SYSPLITH/hr) due to
 wind shear, before it may be split
 (SHSPLITH)               Default:  2.       ! SHSPLITH = 2.0 !
```

Minimum concentration (g/m^3) of each
species in puff before it may be split
Enter array of NSPEC values; if a single value is
entered, it will be used for ALL species
(CNSPLITH) Default: 1.0E-07 ! CNSPLITH = 1.0E-07 !

Integration control variables ------------------------

Fractional convergence criterion for numerical SLUG
sampling integration
(EPSSLUG) Default: 1.0e-04 ! EPSSLUG = 1.0E-04 !

Fractional convergence criterion for numerical AREA
source integration
(EPSAREA) Default: 1.0e-06 ! EPSAREA = 1.0E-06 !

Trajectory step-length (m) used for numerical rise
integration
(DSRISE) Default: 1.0 ! DSRISE = 1.0 !

Boundary Condition (BC) Puff control variables ------------------------

Minimum height (m) to which BC puffs are mixed as they are emitted
(MBCON=2 ONLY). Actual height is reset to the current mixing height
at the release point if greater than this minimum.
(HTMINBC) Default: 500. ! HTMINBC = 500.0 !

Search radius (in BC segment lengths) about a receptor for sampling
nearest BC puff. BC puffs are emitted with a spacing of one segment
length, so the search radius should be greater than 1.
(RSAMPBC) Default: 4. ! RSAMPBC = 10.0 !

Near-Surface depletion adjustment to concentration profile used when
sampling BC puffs?
(MDEPBC) Default: 1 ! MDEPBC = 1 !
0 = Concentration is NOT adjusted for depletion
1 = Adjust Concentration for depletion

!END!

--------

  a
   Data for each source are treated as a separate input subgroup
   and therefore must end with an input group terminator.

   SRCNAM  is a 12-character name for a source
           (No default)
   X       is an array holding the source data listed by the column headings
           (No default)
   SIGYZI  is an array holding the initial sigma-y and sigma-z (m)
           (Default: 0.,0.)
   FMFAC   is a vertical momentum flux factor (0. or 1.0) used to represent
           the effect of rain-caps or other physical configurations that
           reduce momentum rise associated with the actual exit velocity.
           (Default: 1.0  -- full momentum used)

  b
```

0. = No building downwash modeled, 1. = downwash modeled
NOTE: must be entered as a REAL number (i.e., with decimal point)

c
An emission rate must be entered for every pollutant modeled.
Enter emission rate of zero for secondary pollutants that are
modeled, but not emitted. Units are specified by IPTU
(e.g. 1 for g/s).

Subgroup (13c)

BUILDING DIMENSION DATA FOR SOURCES SUBJECT TO DOWNWASH

Source a
No. Effective building height, width, length and X/Y offset (in meters)
every 10 degrees. LENGTH, XBADJ, and YBADJ are only needed for
MBDW=2 (PRIME downwash option)
------ --

----

a
Building height, width, length, and X/Y offset from the source are treated
as a separate input subgroup for each source and therefore must end with
an input group terminator. The X/Y offset is the position, relative to the
stack, of the center of the upwind face of the projected building, with the
x-axis pointing along the flow direction.

```

----

a

Data for each receptor are treated as a separate input subgroup and therefore must end with an input group terminator.

b

Receptor height above ground is optional. If no value is entered, the receptor is placed on the ground.

        METRUN = 0 - Run period explicitly defined below
        METRUN = 1 - Run all periods in met. file

    Starting date:   Year (IBYR) -- No default       ! IBYR =  2001  !
    (used only if   Month (IBMO) -- No default       ! IBMO =  9  !
     METRUN = 0)      Day (IBDY) -- No default       ! IBDY =  27 !
                     Hour (IBHR) -- No default       ! IBHR =  0  !

    Base time zone        (XBTZ) -- No default       ! XBTZ = 0.0  !
       PST = 8., MST = 7.
       CST = 6., EST = 5.

    Length of run (hours) (IRLG) -- No default       ! IRLG =  2304 !

    Number of chemical species (NSPEC)
```

```
                     Default: 5      ! NSPEC =  6   !

  Number of chemical species
  to be emitted  (NSE)          Default: 3      ! NSE =  3   !

  Flag to stop run after
  SETUP phase (ITEST)           Default: 2      ! ITEST =  2   !
  (Used to allow checking
  of the model inputs, files, etc.)
      ITEST = 1 - STOPS program after SETUP phase
      ITEST = 2 - Continues with execution of program
              after SETUP

  Restart Configuration:

    Control flag (MRESTART)      Default: 0      ! MRESTART =  0   !

      0 = Do not read or write a restart file
      1 = Read a restart file at the beginning of
          the run
      2 = Write a restart file during run
      3 = Read a restart file at beginning of run
          and write a restart file during run

    Number of periods in Restart
    output cycle (NRESPD)       Default: 0      ! NRESPD =  0   !

      0 = File written only at last period
     >0 = File updated every NRESPD periods

  Meteorological Data Format (METFM)
                     Default: 1      ! METFM =  1   !

      METFM = 1 - CALMET binary file (CALMET.MET)
      METFM = 2 - ISC ASCII file (ISCMET.MET)
      METFM = 3 - AUSPLUME ASCII file (PLMMET.MET)
      METFM = 4 - CTDM plus tower file (PROFILE.DAT) and
              surface parameters file (SURFACE.DAT)

 Meteorological Profile Data Format (MPRFFM)
        (used only for METFM = 1, 2, 3)
                     Default: 1      ! MPRFFM =  1   !

      MPRFFM = 1 - CTDM plus tower file (PROFILE.DAT)
      MPRFFM = 2 - AERMET tower file (PROFILE.DAT)

  PG sigma-y is adjusted by the factor (AVET/PGTIME)**0.2
  Averaging Time (minutes) (AVET)
                     Default: 60.0    ! AVET = 60. !
  PG Averaging Time (minutes) (PGTIME)
                     Default: 60.0    ! PGTIME = 60. !

!END!
```

```
-------------------------------------------------------------------------------

INPUT GROUP: 2 -- Technical options
--------------

    Vertical distribution used in the
    near field (MGAUSS)                 Default: 1     ! MGAUSS =  1   !
      0 = uniform
      1 = Gaussian

    Terrain adjustment method
    (MCTADJ)                            Default: 3     ! MCTADJ =  3   !
      0 = no adjustment
      1 = ISC-type of terrain adjustment
      2 = simple, CALPUFF-type of terrain
          adjustment

2 = user-specified transformation
rates used
3 = transformation rates computed
internally (RIVAD/ARM3 scheme)
4 = secondary organic aerosol formation
computed (MESOPUFF II scheme for OH)

Aqueous phase transformation flag (MAQCHEM)
(Used only if MCHEM = 1, or 3)   Default: 0   ! MAQCHEM = 0   !
0 = aqueous phase transformation
not modeled
1 = transformation rates adjusted
for aqueous phase reactions

Wet removal modeled ? (MWET)   Default: 1   ! MWET = 1   !
0 = no
1 = yes

Dry deposition modeled ? (MDRY)   Default: 1   ! MDRY = 1   !
0 = no
1 = yes
(dry deposition method specified
for each species in Input Group 3)

Method used to compute dispersion
coefficients (MDISP)   Default: 3   ! MDISP = 3   !

1 = dispersion coefficients computed from measured values
of turbulence, sigma v, sigma w
2 = dispersion coefficients from internally calculated
sigma v, sigma w using micrometeorological variables
(u*, w*, L, etc.)
3 = PG dispersion coefficients for RURAL areas (computed using
the ISCST multi-segment approximation) and MP coefficients in
urban areas
4 = same as 3 except PG coefficients computed using
the MESOPUFF II eqns.
5 = CTDM sigmas used for stable and neutral conditions.
For unstable conditions, sigmas are computed as in
MDISP = 3, described above. MDISP = 5 assumes that
measured values are read

Sigma-v/sigma-theta, sigma-w measurements used? (MTURBVW)
(Used only if MDISP = 1 or 5)   Default: 3   ! MTURBVW = 3 !
1 = use sigma-v or sigma-theta measurements
from PROFILE.DAT to compute sigma-y
(valid for METFM = 1, 2, 3, 4)
2 = use sigma-w measurements
from PROFILE.DAT to compute sigma-z
(valid for METFM = 1, 2, 3, 4)
3 = use both sigma-(v/theta) and sigma-w
from PROFILE.DAT to compute sigma-y and sigma-z
(valid for METFM = 1, 2, 3, 4)
4 = use sigma-theta measurements
from PLMMET.DAT to compute sigma-y

(valid only if METFM = 3)

Back-up method used to compute dispersion
when measured turbulence data are
missing (MDISP2)   Default: 3   ! MDISP2 = 3 !
(used only if MDISP = 1 or 5)
  2 = dispersion coefficients from internally calculated
      sigma v, sigma w using micrometeorological variables
      (u*, w*, L, etc.)
  3 = PG dispersion coefficients for RURAL areas (computed using
      the ISCST multi-segment approximation) and MP coefficients in
      urban areas
  4 = same as 3 except PG coefficients computed using
      the MESOPUFF II eqns.

[DIAGNOSTIC FEATURE]
Method used for Lagrangian timescale for Sigma-y
(used only if MDISP=1,2 or MDISP2=1,2)
(MTAULY)   Default: 0   ! MTAULY = 0 !

Boundary conditions (concentration) modeled?
Default: 0 ! MBCON = 0 !
(MBCON)
0 = no
1 = yes, using formatted BCON.DAT file
2 = yes, using unformatted CONC.DAT file

Analyses of fogging and icing impacts due to emissions from arrays of mechanically-forced cooling towers can be performed using CALPUFF in conjunction with a cooling tower emissions processor (CTEMISS) and its associated postprocessors. Hourly emissions of water vapor and temperature from each cooling tower cell are computed for the current cell configuration and ambient conditions by CTEMISS. CALPUFF models the dispersion of these emissions and provides cloud information in a specialized format for further analysis. Output to FOG.DAT is provided in either 'plume mode' or 'receptor mode' format.

Configure for FOG Model output?
Default: 0 ! MFOG = 0 !
(MFOG)
0 = no
1 = yes - report results in PLUME Mode format
2 = yes - report results in RECEPTOR Mode format

Test options specified to see if
they conform to regulatory
values? (MREG) Default: 1 ! MREG = 1 !

Subgroup (3b)

The following names are used for Species-Groups in which results
for certain species are combined (added) prior to output. The
CGRUP name will be used as the species name in output files.
Use this feature to model specific particle-size distributions
by treating each size-range as a separate species.
Order must be consistent with 3(a) above.

     UTM zone (1 to 60)
     (Used only if PMAP=UTM)
     (IUTMZN)                   No Default      ! IUTMZN =  15   !

     Hemisphere for UTM projection?
     (Used only if PMAP=UTM)
     (UTMHEM)                   Default: N      ! UTMHEM = N  !
        N   :  Northern hemisphere projection
        S   :  Southern hemisphere projection

     Latitude and Longitude (decimal degrees) of projection origin
     (Used only if PMAP= TTM, LCC, PS, EM, or LAZA)
     (RLAT0)                    No Default      ! RLAT0 = 40N  !
     (RLON0)                    No Default      ! RLON0 = 97W  !

        TTM :  RLON0 identifies central (true N/S) meridian of projection
               RLAT0 selected for convenience
        LCC :  RLON0 identifies central (true N/S) meridian of projection
               RLAT0 selected for convenience
        PS  :  RLON0 identifies central (grid N/S) meridian of projection
               RLAT0 selected for convenience
        EM  :  RLON0 identifies central meridian of projection
               RLAT0 is REPLACED by 0.0N (Equator)
        LAZA:  RLON0 identifies longitude of tangent-point of mapping plane
               RLAT0 identifies latitude of tangent-point of mapping plane

     Matching parallel(s) of latitude (decimal degrees) for projection
     (Used only if PMAP= LCC or PS)
     (XLAT1)                    No Default      ! XLAT1 = 33N  !
     (XLAT2)                    No Default      ! XLAT2 = 45N  !
```

LCC : Projection cone slices through Earth's surface at XLAT1 and XLAT2
PS : Projection plane slices through Earth at XLAT1
(XLAT2 is not used)

Note: Latitudes and longitudes should be positive, and include a
letter N,S,E, or W indicating north or south latitude, and
east or west longitude. For example,
35.9 N Latitude = 35.9N
118.7 E Longitude = 118.7E

Datum-region

The Datum-Region for the coordinates is identified by a character string. Many mapping products currently available use the model of the Earth known as the World Geodetic System 1984 (WGS-G). Other local models may be in use, and their selection in CALMET will make its output consistent with local mapping products. The list of Datum-Regions with official transformation parameters is provided by the National Imagery and Mapping Agency (NIMA).

NIMA Datum - Regions(Examples)

WGS-G   WGS-84 GRS 80 Spheroid, Global coverage (WGS84)
NAS-C   NORTH AMERICAN 1927 Clarke 1866 Spheroid, MEAN FOR CONUS (NAD27)
NWS-27   NWS 6370KM Radius, Sphere
NWS-84   NWS 6370KM Radius, Sphere
ESR-S   ESRI REFERENCE 6371KM Radius, Sphere

Datum-region for output coordinates
(DATUM)   Default: WGS-G   ! DATUM = WGS-G !

METEOROLOGICAL Grid:

Rectangular grid defined for projection PMAP,
with X the Easting and Y the Northing coordinate

No. X grid cells (NX)   No default   ! NX = 366   !
No. Y grid cells (NY)   No default   ! NY = 234   !
No. vertical layers (NZ)   No default   ! NZ = 10   !

Grid spacing (DGRIDKM)   No default   ! DGRIDKM = 6 !
Units: km

Cell face heights
(ZFACE(nz+1))   No defaults
Units: m
! ZFACE = 0., 20., 40., 80., 160., 320., 640., 1200., 2000., 3000.,
4000. !

Reference Coordinates
of SOUTHWEST corner of
grid cell(1, 1):

X-coordinate (XORIGKM)   No default   ! XORIGKM = -1008. !
Y coordinate (YORIGKM)   No default   ! YORIGKM = -864. !
Units: km

COMPUTATIONAL Grid:

The computational grid is identical to or a subset of the MET. grid. The lower left (LL) corner of the computational grid is at grid point (IBCOMP, JBCOMP) of the MET. grid. The upper right (UR) corner of the computational grid is at grid point (IECOMP, JECOMP) of the MET. grid. The grid spacing of the computational grid is the same as the MET. grid.

X index of LL corner (IBCOMP)   No default   ! IBCOMP = 200   !
(1 <= IBCOMP <= NX)

Y index of LL corner (JBCOMP)   No default   ! JBCOMP = 50   !
(1 <= JBCOMP <= NY)

X index of UR corner (IECOMP)   No default   ! IECOMP = 320   !
(1 <= IECOMP <= NX)

Y index of UR corner (JECOMP)   No default   ! JECOMP = 160   !
(1 <= JECOMP <= NY)

SAMPLING Grid (GRIDDED RECEPTORS):

The lower left (LL) corner of the sampling grid is at grid point (IBSAMP, JBSAMP) of the MET. grid. The upper right (UR) corner of the sampling grid is at grid point (IESAMP, JESAMP) of the MET. grid. The sampling grid must be identical to or a subset of the computational grid. It may be a nested grid inside the computational grid. The grid spacing of the sampling grid is DGRIDKM/MESHDN.

Logical flag indicating if gridded
receptors are used (LSAMP)   Default: T   ! LSAMP = F !
(T=yes, F=no)

X index of LL corner (IBSAMP)   No default   ! IBSAMP = 1   !
(IBCOMP <= IBSAMP <= IECOMP)

Y index of LL corner (JBSAMP)   No default   ! JBSAMP = 1   !
(JBCOMP <= JBSAMP <= JECOMP)

X index of UR corner (IESAMP)   No default   ! IESAMP = 251   !
(IBCOMP <= IESAMP <= IECOMP)

Y index of UR corner (JESAMP)   No default   ! JESAMP = 246   !
(JBCOMP <= JESAMP <= JECOMP)

Nesting factor of the sampling

```
      grid (MESHDN)                    Default: 1     ! MESHDN =  1  !
      (MESHDN is an integer >= 1)

```

1

Description of Complex Terrain Variables:
- XC, YC = Coordinates of center of hill
- THETAH = Orientation of major axis of hill (clockwise from North)
- ZGRID = Height of the 0 of the grid above mean sea level
- RELIEF = Height of the crest of the hill above the grid elevation
- EXPO 1 = Hill-shape exponent for the major axis
- EXPO 2 = Hill-shape exponent for the major axis
- SCALE 1 = Horizontal length scale along the major axis
- SCALE 2 = Horizontal length scale along the minor axis
- AMAX = Maximum allowed axis length for the major axis
- BMAX = Maximum allowed axis length for the major axis

- XRCT, YRCT = Coordinates of the complex terrain receptors
- ZRCT = Height of the ground (MSL) at the complex terrain Receptor
- XHH = Hill number associated with each complex terrain receptor (NOTE: MUST BE ENTERED AS A REAL NUMBER)

**

NOTE: DATA for each hill and CTSG receptor are treated as a separate input subgroup and therefore must end with an input group terminator.

INPUT GROUP: 7 -- Chemical parameters for dry deposition of gases

!END!

INPUT GROUP: 8 -- Size parameters for dry deposition of particles

----

For SINGLE SPECIES, the mean and standard deviation are used to compute a deposition velocity for NINT (see group 9) size-ranges, and these are then averaged to obtain a mean deposition velocity.

For GROUPED SPECIES, the size distribution should be explicitly specified (by the 'species' in the group), and the standard deviation for each should be entered as 0. The model will then use the deposition velocity for the stated mean diameter.

	SPECIES NAME	GEOMETRIC MASS MEAN DIAMETER (microns)	GEOMETRIC STANDARD DEVIATION (microns)

INPUT GROUP: 12 -- Misc. Dispersion and Computational Parameters

----

Horizontal size of puff (m) beyond which
time-dependent dispersion equations (Heffter)
are used to determine sigma-y and
sigma-z (SYTDEP)   Default: 550.   ! SYTDEP = 5.5E02 !

Switch for using Heffter equation for sigma z
as above (0 = Not use Heffter; 1 = use Heffter
(MHFTSZ)   Default: 0   ! MHFTSZ = 0   !

Stability class used to determine plume
growth rates for puffs above the boundary
layer (JSUP)   Default: 5   ! JSUP = 5   !

Vertical dispersion constant for stable
conditions (k1 in Eqn. 2.7-3) (CONK1)   Default: 0.01   ! CONK1 = .01 !

Vertical dispersion constant for neutral/
unstable conditions (k2 in Eqn. 2.7-4)
(CONK2)   Default: 0.1   ! CONK2 = .1 !

Factor for determining Transition-point from
Schulman-Scire to Huber-Snyder Building Downwash
scheme (SS used for Hs < Hb + TBD * HL)
(TBD)   Default: 0.5   ! TBD = .5 !
TBD < 0   ==> always use Huber-Snyder
TBD = 1.5 ==> always use Schulman-Scire
TBD = 0.5 ==> ISC Transition-point

Range of land use categories for which
urban dispersion is assumed
(IURB1, IURB2)   Default: 10   ! IURB1 = 10 !
19   ! IURB2 = 19 !

Site characterization parameters for single-point Met data files ---------
(needed for METFM = 2,3,4)

Land use category for modeling domain
(ILANDUIN)   Default: 20   ! ILANDUIN = 20 !

Roughness length (m) for modeling domain
(Z0IN)   Default: 0.25   ! Z0IN = .25 !

Leaf area index for modeling domain
(XLAIIN)   Default: 3.0   ! XLAIIN = 3.0 !

Elevation above sea level (m)
(ELEVIN)   Default: 0.0   ! ELEVIN = .0 !

Latitude (degrees) for met location
(XLATIN)   Default: -999. ! XLATIN = -999.0 !

Longitude (degrees) for met location
(XLONIN)   Default: -999. ! XLONIN = -999.0 !

Specialized information for interpreting single-point Met data files -----

Anemometer height (m) (Used only if METFM = 2,3)
(ANEMHT) Default: 10. ! ANEMHT = 10.0 !

Form of lateral turbulance data in PROFILE.DAT file
(Used only if METFM = 4 or MTURBVW = 1 or 3)
(ISIGMAV) Default: 1 ! ISIGMAV = 1 !
0 = read sigma-theta
1 = read sigma-v

Choice of mixing heights (Used only if METFM = 4)
(IMIXCTDM) Default: 0 ! IMIXCTDM = 0 !
0 = read PREDICTED mixing heights
1 = read OBSERVED mixing heights

Maximum length of a slug (met. grid units)
(XMXLEN) Default: 1.0 ! XMXLEN = 1.0 !

Maximum travel distance of a puff/slug (in
grid units) during one sampling step
(XSAMLEN) Default: 1.0 ! XSAMLEN = 1.0 !

Maximum Number of slugs/puffs release from
one source during one time step
(MXNEW) Default: 99 ! MXNEW = 99 !

Maximum Number of sampling steps for
one puff/slug during one time step
(MXSAM) Default: 99 ! MXSAM = 99 !

Number of iterations used when computing
the transport wind for a sampling step
that includes gradual rise (for CALMET
and PROFILE winds)
(NCOUNT) Default: 2 ! NCOUNT = 2 !

Minimum sigma y for a new puff/slug (m)
(SYMIN) Default: 1.0 ! SYMIN = 1.0 !

Minimum sigma z for a new puff/slug (m)
(SZMIN) Default: 1.0 ! SZMIN = 1.0 !

Default minimum turbulence velocities sigma-v and sigma-w
for each stability class over land and over water (m/s)
(SVMIN(12) and SWMIN(12))

```
              ---------- LAND ----------       --------- WATER ----------

Divergence criterion for dw/dz across puff
used to initiate adjustment for horizontal
convergence (1/s)
Partial adjustment starts at CDIV(1), and
full adjustment is reached at CDIV(2)
(CDIV(2))   Default: 0.0,0.0 ! CDIV = .0, .0 !

Minimum wind speed (m/s) allowed for
non-calm conditions. Also used as minimum
speed returned when using power-law
extrapolation toward surface
(WSCALM)   Default: 0.5   ! WSCALM = .5 !

Maximum mixing height (m)
(XMAXZI)   Default: 3000. ! XMAXZI = 4000.0 !

Minimum mixing height (m)
(XMINZI)   Default: 50.   ! XMINZI = 20.0 !

Default wind speed classes --
5 upper bounds (m/s) are entered;
the 6th class has no upper limit
(WSCAT(5))   Default   :
ISC RURAL : 1.54, 3.09, 5.14, 8.23, 10.8 (10.8+)

Wind Speed Class : 1   2   3   4   5
--- --- --- --- ---
! WSCAT = 1.54, 3.09, 5.14, 8.23, 10.80 !

Default wind speed profile power-law
exponents for stabilities 1-6
(PLX0(6))   Default   : ISC RURAL values
ISC RURAL : .07, .07, .10, .15, .35, .55
ISC URBAN : .15, .15, .20, .25, .30, .30

Stability Class : A   B   C   D   E   F
--- --- --- --- --- ---
! PLX0 = 0.07, 0.07, 0.10, 0.15, 0.35, 0.55 !

Default potential temperature gradient
for stable classes E, F (degK/m)
(PTG0(2))   Default: 0.020, 0.035
! PTG0 = 0.020,   0.035 !

Default plume path coefficients for
each stability class (used when option
for partial plume height terrain adjustment
is selected -- MCTADJ=3)
(PPC(6))   Stability Class : A   B   C   D   E   F
Default PPC : .50, .50, .50, .50, .35, .35
--- --- --- --- --- ---
! PPC = 0.50, 0.50, 0.50, 0.50, 0.35, 0.35 !

Slug-to-puff transition criterion factor
equal to sigma-y/length of slug
(SL2PF)   Default: 10.   ! SL2PF = 10.0 !

Puff-splitting control variables ------------------------

VERTICAL SPLIT

Number of puffs that result every time a puff
is split - nsplit=2 means that 1 puff splits
into 2
(NSPLIT)   Default: 3   ! NSPLIT = 3 !

Time(s) of a day when split puffs are eligible to
be split once again; this is typically set once
per day, around sunset before nocturnal shear develops.
24 values: 0 is midnight (00:00) and 23 is 11 PM (23:00)
0=do not re-split   1=eligible for re-split
(IRESPLIT(24))   Default: Hour 17 = 1
! IRESPLIT = 0,0,0,0,0,0,0,0,0,0,0,0,0,0,0,0,0,1,0,0,0,0,0,0 !

Split is allowed only if last hour's mixing
height (m) exceeds a minimum value
(ZISPLIT)   Default: 100.   ! ZISPLIT = 100.0 !

Split is allowed only if ratio of last hour's
mixing ht to the maximum mixing ht experienced
by the puff is less than a maximum value (this
postpones a split until a nocturnal layer develops)
(ROLDMAX)   Default: 0.25   ! ROLDMAX = 0.25 !

HORIZONTAL SPLIT

Number of puffs that result every time a puff
is split - nsplith=5 means that 1 puff splits
into 5
(NSPLITH)   Default: 5   ! NSPLITH = 5 !

Minimum sigma-y (Grid Cells Units) of puff
before it may be split
(SYSPLITH)   Default: 1.0   ! SYSPLITH = 1.0 !

Minimum puff elongation rate (SYSPLITH/hr) due to
wind shear, before it may be split
(SHSPLITH)   Default: 2.   ! SHSPLITH = 2.0 !

Minimum concentration (g/m^3) of each
species in puff before it may be split
Enter array of NSPEC values; if a single value is
entered, it will be used for ALL species
(CNSPLITH)   Default: 1.0E-07   ! CNSPLITH = 1.0E-07 !

Integration control variables ------------------------

Fractional convergence criterion for numerical SLUG
sampling integration
(EPSSLUG)   Default: 1.0e-04 ! EPSSLUG = 1.0E-04 !

Fractional convergence criterion for numerical AREA
source integration
(EPSAREA) Default: 1.0e-06 ! EPSAREA = 1.0E-06 !

Trajectory step-length (m) used for numerical rise
integration
(DSRISE) Default: 1.0 ! DSRISE = 1.0 !

Boundary Condition (BC) Puff control variables ------------------------

Minimum height (m) to which BC puffs are mixed as they are emitted
(MBCON=2 ONLY). Actual height is reset to the current mixing height
at the release point if greater than this minimum.
(HTMINBC) Default: 500. ! HTMINBC = 500.0 !

Search radius (in BC segment lengths) about a receptor for sampling
nearest BC puff. BC puffs are emitted with a spacing of one segment
length, so the search radius should be greater than 1.
(RSAMPBC) Default: 4. ! RSAMPBC = 10.0 !

Near-Surface depletion adjustment to concentration profile used when
sampling BC puffs?
(MDEPBC) Default: 1 ! MDEPBC = 1 !
0 = Concentration is NOT adjusted for depletion
1 = Adjust Concentration for depletion

--------

   a
    Data for each source are treated as a separate input subgroup
    and therefore must end with an input group terminator.

    SRCNAM  is a 12-character name for a source
           (No default)
    X       is an array holding the source data listed by the column headings
           (No default)
    SIGYZI  is an array holding the initial sigma-y and sigma-z (m)
           (Default: 0.,0.)
    FMFAC   is a vertical momentum flux factor (0. or 1.0) used to represent
           the effect of rain-caps or other physical configurations that
           reduce momentum rise associated with the actual exit velocity.
           (Default: 1.0  -- full momentum used)

   b
    0. = No building downwash modeled, 1. = downwash modeled
    NOTE: must be entered as a REAL number (i.e., with decimal point)

   c
    An emission rate must be entered for every pollutant modeled.
    Enter emission rate of zero for secondary pollutants that are
    modeled, but not emitted.  Units are specified by IPTU
```

(e.g. 1 for g/s).

Subgroup (13c)

BUILDING DIMENSION DATA FOR SOURCES SUBJECT TO DOWNWASH

```
Source                                                   a
 No.      Effective building height, width, length and X/Y offset (in meters)
          every 10 degrees.  LENGTH, XBADJ, and YBADJ are only needed for
          MBDW=2 (PRIME downwash option)
------    ------------------------------------------------------------------
```

----

a
Building height, width, length, and X/Y offset from the source are treated as a separate input subgroup for each source and therefore must end with an input group terminator. The X/Y offset is the position, relative to the stack, of the center of the upwind face of the projected building, with the x-axis pointing along the flow direction.

----

a

Data for each receptor are treated as a separate input subgroup and therefore must end with an input group terminator.

b

Receptor height above ground is optional. If no value is entered, the receptor is placed on the ground.

INPUT GROUP: 1 -- General run control parameters

  Option to run all periods found
  in the met. file   (METRUN)   Default: 0   ! METRUN =   0 !

    METRUN = 0 - Run period explicitly defined below
    METRUN = 1 - Run all periods in met. file

Starting date: Year (IBYR) -- No default ! IBYR = 2003 !
(used only if Month (IBMO) -- No default ! IBMO = 9 !
METRUN = 0) Day (IBDY) -- No default ! IBDY = 27 !
Hour (IBHR) -- No default ! IBHR = 0 !

Base time zone (XBTZ) -- No default ! XBTZ = 0.0 !
PST = 8., MST = 7.
CST = 6., EST = 5.

Length of run (hours) (IRLG) -- No default ! IRLG = 2304 !

Number of chemical species (NSPEC)
Default: 5 ! NSPEC = 6 !

Number of chemical species
to be emitted (NSE) Default: 3 ! NSE = 3 !

Flag to stop run after
SETUP phase (ITEST) Default: 2 ! ITEST = 2 !
(Used to allow checking
of the model inputs, files, etc.)
ITEST = 1 - STOPS program after SETUP phase
ITEST = 2 - Continues with execution of program
after SETUP

Restart Configuration:

Control flag (MRESTART) Default: 0 ! MRESTART = 0 !

0 = Do not read or write a restart file
1 = Read a restart file at the beginning of
the run
2 = Write a restart file during run
3 = Read a restart file at beginning of run
and write a restart file during run

Number of periods in Restart
output cycle (NRESPD) Default: 0 ! NRESPD = 0 !

0 = File written only at last period
>0 = File updated every NRESPD periods

Meteorological Data Format (METFM)
Default: 1 ! METFM = 1 !

METFM = 1 - CALMET binary file (CALMET.MET)
METFM = 2 - ISC ASCII file (ISCMET.MET)
METFM = 3 - AUSPLUME ASCII file (PLMMET.MET)
METFM = 4 - CTDM plus tower file (PROFILE.DAT) and
surface parameters file (SURFACE.DAT)

Meteorological Profile Data Format (MPRFFM)
(used only for METFM = 1, 2, 3)
Default: 1 ! MPRFFM = 1 !

MPRFFM = 1 - CTDM plus tower file (PROFILE.DAT)

MPRFFM = 2 - AERMET tower file (PROFILE.DAT)

PG sigma-y is adjusted by the factor (AVET/PGTIME)**0.2
Averaging Time (minutes) (AVET)
Default: 60.0 ! AVET = 60. !
PG Averaging Time (minutes) (PGTIME)
Default: 60.0 ! PGTIME = 60. !

!END!

INPUT GROUP: 2 -- Technical options

Vertical distribution used in the
near field (MGAUSS) Default: 1 ! MGAUSS = 1 !
0 = uniform
1 = Gaussian

Terrain adjustment method
(MCTADJ) Default: 3 ! MCTADJ = 3 !
0 = no adjustment
1 = ISC-type of terrain adjustment
2 = simple, CALPUFF-type of terrain
adjustment
3 = partial plume path adjustment

Subgrid-scale complex terrain
flag (MCTSG) Default: 0 ! MCTSG = 0 !
0 = not modeled
1 = modeled

Near-field puffs modeled as
elongated 0 (MSLUG) Default: 0 ! MSLUG = 0 !
0 = no
1 = yes (slug model used)

Transitional plume rise modeled ?
(MTRANS) Default: 1 ! MTRANS = 1 !
0 = no (i.e., final rise only)
1 = yes (i.e., transitional rise computed)

Stack tip downwash? (MTIP) Default: 1 ! MTIP = 1 !
0 = no (i.e., no stack tip downwash)
1 = yes (i.e., use stack tip downwash)

Method used to simulate building
downwash? (MBDW) Default: 1 ! MBDW = 1 !
1 = ISC method
2 = PRIME method

Vertical wind shear modeled above

stack top? (MSHEAR) Default: 0 ! MSHEAR = 0 !
0 = no (i.e., vertical wind shear not modeled)
1 = yes (i.e., vertical wind shear modeled)

Puff splitting allowed? (MSPLIT) Default: 0 ! MSPLIT = 0 !
0 = no (i.e., puffs not split)
1 = yes (i.e., puffs are split)

Chemical mechanism flag (MCHEM) Default: 1 ! MCHEM = 1 !
0 = chemical transformation not modeled
1 = transformation rates computed internally (MESOPUFF II scheme)
2 = user-specified transformation rates used
3 = transformation rates computed internally (RIVAD/ARM3 scheme)
4 = secondary organic aerosol formation computed (MESOPUFF II scheme for OH)

Aqueous phase transformation flag (MAQCHEM)
(Used only if MCHEM = 1, or 3) Default: 0 ! MAQCHEM = 0 !
0 = aqueous phase transformation not modeled
1 = transformation rates adjusted for aqueous phase reactions

Wet removal modeled ? (MWET) Default: 1 ! MWET = 1 !
0 = no
1 = yes

Dry deposition modeled ? (MDRY) Default: 1 ! MDRY = 1 !
0 = no
1 = yes
(dry deposition method specified for each species in Input Group 3)

Method used to compute dispersion
coefficients (MDISP) Default: 3 ! MDISP = 3 !

1 = dispersion coefficients computed from measured values of turbulence, sigma v, sigma w
2 = dispersion coefficients from internally calculated sigma v, sigma w using micrometeorological variables (u*, w*, L, etc.)
3 = PG dispersion coefficients for RURAL areas (computed using the ISCST multi-segment approximation) and MP coefficients in urban areas
4 = same as 3 except PG coefficients computed using the MESOPUFF II eqns.
5 = CTDM sigmas used for stable and neutral conditions. For unstable conditions, sigmas are computed as in MDISP = 3, described above. MDISP = 5 assumes that measured values are read

Sigma-v/sigma-theta, sigma-w measurements used? (MTURBVW)

(Used only if MDISP = 1 or 5)   Default: 3   ! MTURBVW = 3 !
1 = use sigma-v or sigma-theta measurements
from PROFILE.DAT to compute sigma-y
(valid for METFM = 1, 2, 3, 4)
2 = use sigma-w measurements
from PROFILE.DAT to compute sigma-z
(valid for METFM = 1, 2, 3, 4)
3 = use both sigma-(v/theta) and sigma-w
from PROFILE.DAT to compute sigma-y and sigma-z
(valid for METFM = 1, 2, 3, 4)
4 = use sigma-theta measurements
from PLMMET.DAT to compute sigma-y
(valid only if METFM = 3)

Back-up method used to compute dispersion
when measured turbulence data are
missing (MDISP2)   Default: 3   ! MDISP2 = 3 !
(used only if MDISP = 1 or 5)
2 = dispersion coefficients from internally calculated
sigma v, sigma w using micrometeorological variables
(u*, w*, L, etc.)
3 = PG dispersion coefficients for RURAL areas (computed using
the ISCST multi-segment approximation) and MP coefficients in
urban areas
4 = same as 3 except PG coefficients computed using
the MESOPUFF II eqns.

[DIAGNOSTIC FEATURE]
Method used for Lagrangian timescale for Sigma-y
(used only if MDISP=1,2 or MDISP2=1,2)
(MTAULY)   Default: 0   ! MTAULY = 0 !
0 = Draxler default 617.284 (s)
1 = Computed as Lag. Length / (.75 q) -- after SCIPUFF
10 < Direct user input (s)   -- e.g., 306.9

[DIAGNOSTIC FEATURE]
Method used for Advective-Decay timescale for Turbulence
(used only if MDISP=2 or MDISP2=2)
(MTAUADV)   Default: 0   ! MTAUADV = 0 !
0 = No turbulence advection
1 = Computed (OPTION NOT IMPLEMENTED)
10 < Direct user input (s)   -- e.g., 300

Method used to compute turbulence sigma-v &
sigma-w using micrometeorological variables
(Used only if MDISP = 2 or MDISP2 = 2)
(MCTURB)   Default: 1   ! MCTURB = 1 !
1 = Standard CALPUFF subroutines
2 = AERMOD subroutines

PG sigma-y,z adj. for roughness?   Default: 0   ! MROUGH = 0 !
(MROUGH)
0 = no
1 = yes

Partial plume penetration of elevated inversion? (MPARTL)   Default: 1   ! MPARTL = 1 !
0 = no
1 = yes

Strength of temperature inversion provided in PROFILE.DAT extended records? (MTINV)   Default: 0   ! MTINV = 0 !
0 = no (computed from measured/default gradients)
1 = yes

PDF used for dispersion under convective conditions? (MPDF)   Default: 0   ! MPDF = 0 !
0 = no
1 = yes

Sub-Grid TIBL module used for shore line? (MSGTIBL)   Default: 0   ! MSGTIBL = 0 !
0 = no
1 = yes

Boundary conditions (concentration) modeled? (MBCON)   Default: 0   ! MBCON = 0 !
0 = no
1 = yes, using formatted BCON.DAT file
2 = yes, using unformatted CONC.DAT file

Analyses of fogging and icing impacts due to emissions from arrays of mechanically-forced cooling towers can be performed using CALPUFF in conjunction with a cooling tower emissions processor (CTEMISS) and its associated postprocessors. Hourly emissions of water vapor and temperature from each cooling tower cell are computed for the current cell configuration and ambient conditions by CTEMISS. CALPUFF models the dispersion of these emissions and provides cloud information in a specialized format for further analysis. Output to FOG.DAT is provided in either 'plume mode' or 'receptor mode' format.

Configure for FOG Model output? (MFOG)   Default: 0   ! MFOG = 0 !
0 = no
1 = yes - report results in PLUME Mode format
2 = yes - report results in RECEPTOR Mode format

Test options specified to see if they conform to regulatory values? (MREG)   Default: 1   ! MREG = 1 !

0 = NO checks are made

```
        1 = Technical options must conform to USEPA
            Long Range Transport (LRT) guidance
                     METFM    1 or 2
                     AVET     60. (min)
                     PGTIME   60. (min)
                     MGAUSS   1
                     MCTADJ   3

     (Used only if PMAP=UTM)
     (UTMHEM)                   Default: N      ! UTMHEM = N  !
         N   :  Northern hemisphere projection
         S   :  Southern hemisphere projection

     Latitude and Longitude (decimal degrees) of projection origin
     (Used only if PMAP= TTM, LCC, PS, EM, or LAZA)
     (RLAT0)                    No Default      ! RLAT0 = 40N  !
     (RLON0)                    No Default      ! RLON0 = 97W  !

         TTM :  RLON0 identifies central (true N/S) meridian of projection
                RLAT0 selected for convenience
         LCC :  RLON0 identifies central (true N/S) meridian of projection
                RLAT0 selected for convenience
```

PS : RLON0 identifies central (grid N/S) meridian of projection
RLAT0 selected for convenience
EM : RLON0 identifies central meridian of projection
RLAT0 is REPLACED by 0.0N (Equator)
LAZA: RLON0 identifies longitude of tangent-point of mapping plane
RLAT0 identifies latitude of tangent-point of mapping plane

Matching parallel(s) of latitude (decimal degrees) for projection
(Used only if PMAP= LCC or PS)
(XLAT1) No Default ! XLAT1 = 33N !
(XLAT2) No Default ! XLAT2 = 45N !

LCC : Projection cone slices through Earth's surface at XLAT1 and XLAT2
PS : Projection plane slices through Earth at XLAT1
(XLAT2 is not used)

Note: Latitudes and longitudes should be positive, and include a
letter N,S,E, or W indicating north or south latitude, and
east or west longitude. For example,
35.9 N Latitude = 35.9N
118.7 E Longitude = 118.7E

Datum-region

The Datum-Region for the coordinates is identified by a character string. Many mapping products currently available use the model of the Earth known as the World Geodetic System 1984 (WGS-G). Other local models may be in use, and their selection in CALMET will make its output consistent with local mapping products. The list of Datum-Regions with official transformation parameters is provided by the National Imagery and Mapping Agency (NIMA).

NIMA Datum - Regions(Examples)

WGS-G WGS-84 GRS 80 Spheroid, Global coverage (WGS84)
NAS-C NORTH AMERICAN 1927 Clarke 1866 Spheroid, MEAN FOR CONUS (NAD27)
NWS-27 NWS 6370KM Radius, Sphere
NWS-84 NWS 6370KM Radius, Sphere
ESR-S ESRI REFERENCE 6371KM Radius, Sphere

Datum-region for output coordinates

(DATUM) Default: WGS-G ! DATUM = WGS-G !

METEOROLOGICAL Grid:

Rectangular grid defined for projection PMAP,
with X the Easting and Y the Northing coordinate

No. X grid cells (NX) No default ! NX = 366 !
No. Y grid cells (NY) No default ! NY = 234 !
No. vertical layers (NZ) No default ! NZ = 10 !

Grid spacing (DGRIDKM)   No default   ! DGRIDKM = 6 !
Units: km

Cell face heights
(ZFACE(nz+1))   No defaults
Units: m
! ZFACE = 0., 20., 40., 80., 160., 320., 640., 1200., 2000., 3000.,
4000. !

Reference Coordinates
of SOUTHWEST corner of
grid cell(1, 1):

X-coordinate (XORIGKM)   No default   ! XORIGKM = -1008. !
Y coordinate (YORIGKM)   No default   ! YORIGKM = -864. !
Units: km

COMPUTATIONAL Grid:

The computational grid is identical to or a subset of the MET. grid.
The lower left (LL) corner of the computational grid is at grid point
(IBCOMP, JBCOMP) of the MET. grid. The upper right (UR) corner of the
computational grid is at grid point (IECOMP, JECOMP) of the MET. grid.
The grid spacing of the computational grid is the same as the MET. grid.

X index of LL corner (IBCOMP)   No default   ! IBCOMP = 168 !
(1 <= IBCOMP <= NX)

Y index of LL corner (JBCOMP)   No default   ! JBCOMP = 24 !
(1 <= JBCOMP <= NY)

X index of UR corner (IECOMP)   No default   ! IECOMP = 320 !
(1 <= IECOMP <= NX)

Y index of UR corner (JECOMP)   No default   ! JECOMP = 168 !
(1 <= JECOMP <= NY)

SAMPLING Grid (GRIDDED RECEPTORS):

The lower left (LL) corner of the sampling grid is at grid point
(IBSAMP, JBSAMP) of the MET. grid. The upper right (UR) corner of the
sampling grid is at grid point (IESAMP, JESAMP) of the MET. grid.
The sampling grid must be identical to or a subset of the computational
grid. It may be a nested grid inside the computational grid.
The grid spacing of the sampling grid is DGRIDKM/MESHDN.

Logical flag indicating if gridded
receptors are used (LSAMP)   Default: T   ! LSAMP = F !
(T=yes, F=no)

X index of LL corner (IBSAMP)   No default   ! IBSAMP = 1 !
(IBCOMP <= IBSAMP <= IECOMP)

```
      Y index of LL corner (JBSAMP)      No default     ! JBSAMP =  1   !
       (JBCOMP <= JBSAMP <= JECOMP)

      X index of UR corner (IESAMP)      No default     ! IESAMP =  251   !
       (IBCOMP <= IESAMP <= IECOMP)

      Y index of UR corner (JESAMP)      No default     ! JESAMP =  246   !
       (JBCOMP <= JESAMP <= JECOMP)

     Nesting factor of the sampling
      grid (MESHDN)                   Default: 1     ! MESHDN =  1  !
      (MESHDN is an integer >= 1)

!END!

-------------------------------------------------------------------------------

INPUT GROUP: 8 -- Size parameters for dry deposition of particles
--------------

    For SINGLE SPECIES, the mean and standard deviation are used to
    compute a deposition velocity for NINT (see group 9) size-ranges,
    and these are then averaged to obtain a mean deposition velocity.

    For GROUPED SPECIES, the size distribution should be explicitly
    specified (by the 'species' in the group), and the standard deviation
    for each should be entered as 0.  The model will then use the
    deposition velocity for the stated mean diameter.

INPUT GROUP: 12 -- Misc. Dispersion and Computational Parameters
----

Horizontal size of puff (m) beyond which
time-dependent dispersion equations (Heffter)
are used to determine sigma-y and
sigma-z (SYTDEP) Default: 550. ! SYTDEP = 5.5E02 !

Switch for using Heffter equation for sigma z
as above (0 = Not use Heffter; 1 = use Heffter
(MHFTSZ) Default: 0 ! MHFTSZ = 0 !

Stability class used to determine plume
growth rates for puffs above the boundary
layer (JSUP) Default: 5 ! JSUP = 5 !

Vertical dispersion constant for stable
conditions (k1 in Eqn. 2.7-3) (CONK1) Default: 0.01 ! CONK1 = .01 !

Vertical dispersion constant for neutral/
unstable conditions (k2 in Eqn. 2.7-4)
(CONK2) Default: 0.1 ! CONK2 = .1 !

Factor for determining Transition-point from
Schulman-Scire to Huber-Snyder Building Downwash
scheme (SS used for Hs < Hb + TBD * HL)
(TBD) Default: 0.5 ! TBD = .5 !
TBD < 0 ==> always use Huber-Snyder
TBD = 1.5 ==> always use Schulman-Scire
TBD = 0.5 ==> ISC Transition-point

Range of land use categories for which
urban dispersion is assumed
(IURB1, IURB2) Default: 10 ! IURB1 = 10 !
19 ! IURB2 = 19 !

Site characterization parameters for single-point Met data files ---------
(needed for METFM = 2,3,4)

Land use category for modeling domain
(ILANDUIN) Default: 20 ! ILANDUIN = 20 !

Roughness length (m) for modeling domain
(Z0IN) Default: 0.25 ! Z0IN = .25 !

Leaf area index for modeling domain
(XLAIIN) Default: 3.0 ! XLAIIN = 3.0 !

Elevation above sea level (m)
(ELEVIN) Default: 0.0 ! ELEVIN = .0 !

Latitude (degrees) for met location
(XLATIN) Default: -999. ! XLATIN = -999.0 !

Longitude (degrees) for met location
(XLONIN) Default: -999. ! XLONIN = -999.0 !

Specialized information for interpreting single-point Met data files -----

Anemometer height (m) (Used only if METFM = 2,3)
(ANEMHT) Default: 10. ! ANEMHT = 10.0 !

Form of lateral turbulance data in PROFILE.DAT file
(Used only if METFM = 4 or MTURBVW = 1 or 3)
(ISIGMAV) Default: 1 ! ISIGMAV = 1 !
0 = read sigma-theta
1 = read sigma-v

Choice of mixing heights (Used only if METFM = 4)
(IMIXCTDM) Default: 0 ! IMIXCTDM = 0 !
0 = read PREDICTED mixing heights
1 = read OBSERVED mixing heights

Maximum length of a slug (met. grid units)
(XMXLEN) Default: 1.0 ! XMXLEN = 1.0 !

Maximum travel distance of a puff/slug (in
grid units) during one sampling step
(XSAMLEN) Default: 1.0 ! XSAMLEN = 1.0 !

Maximum Number of slugs/puffs release from
one source during one time step
(MXNEW) Default: 99 ! MXNEW = 99 !

Maximum Number of sampling steps for
one puff/slug during one time step
(MXSAM) Default: 99 ! MXSAM = 99 !

Number of iterations used when computing
the transport wind for a sampling step
that includes gradual rise (for CALMET
and PROFILE winds)
(NCOUNT) Default: 2 ! NCOUNT = 2 !

Minimum sigma y for a new puff/slug (m)
(SYMIN) Default: 1.0 ! SYMIN = 1.0 !

Minimum sigma z for a new puff/slug (m)
(SZMIN) Default: 1.0 ! SZMIN = 1.0 !

Default minimum turbulence velocities sigma-v and sigma-w
for each stability class over land and over water (m/s)
(SVMIN(12) and SWMIN(12))

```

Divergence criterion for dw/dz across puff
used to initiate adjustment for horizontal
convergence (1/s)
Partial adjustment starts at CDIV(1), and
full adjustment is reached at CDIV(2)
(CDIV(2))                        Default: 0.0,0.0  ! CDIV = .0, .0 !

Minimum wind speed (m/s) allowed for
non-calm conditions. Also used as minimum
speed returned when using power-law
extrapolation toward surface
(WSCALM)                          Default: 0.5    ! WSCALM = .5 !

Maximum mixing height (m)
(XMAXZI)                          Default: 3000.  ! XMAXZI = 4000.0 !

Minimum mixing height (m)
(XMINZI)                          Default: 50.    ! XMINZI = 20.0 !

Default wind speed classes --
5 upper bounds (m/s) are entered;
the 6th class has no upper limit
(WSCAT(5))                  Default   :
                      ISC RURAL : 1.54, 3.09, 5.14, 8.23, 10.8 (10.8+)

                 Wind Speed Class :  1     2     3     4     5
                                    ---   ---   ---   ---   ---
                       ! WSCAT = 1.54, 3.09, 5.14, 8.23, 10.80 !

Default wind speed profile power-law
exponents for stabilities 1-6
(PLX0(6))                   Default   : ISC RURAL values
                      ISC RURAL : .07, .07, .10, .15, .35, .55
                      ISC URBAN : .15, .15, .20, .25, .30, .30

                 Stability Class :  A     B     C     D     E     F

Default potential temperature gradient
for stable classes E, F (degK/m)
(PTG0(2))                   Default: 0.020, 0.035
                        ! PTG0 = 0.020,   0.035 !

Default plume path coefficients for
each stability class (used when option
```

for partial plume height terrain adjustment
is selected -- MCTADJ=3)
(PPC(6))   Stability Class : A   B   C   D   E   F
                        Default PPC : .50, .50, .50, .50, .35, .35
                                       ---   ---   ---   ---   ---   ---
                          ! PPC = 0.50, 0.50, 0.50, 0.50, 0.35, 0.35 !

Slug-to-puff transition criterion factor
equal to sigma-y/length of slug
(SL2PF)   Default: 10.   ! SL2PF = 10.0 !

Puff-splitting control variables ------------------------

VERTICAL SPLIT

Number of puffs that result every time a puff
is split - nsplit=2 means that 1 puff splits
into 2
(NSPLIT)   Default: 3   ! NSPLIT = 3 !

Time(s) of a day when split puffs are eligible to
be split once again; this is typically set once
per day, around sunset before nocturnal shear develops.
24 values: 0 is midnight (00:00) and 23 is 11 PM (23:00)
0=do not re-split   1=eligible for re-split
(IRESPLIT(24))   Default: Hour 17 = 1
! IRESPLIT = 0,0,0,0,0,0,0,0,0,0,0,0,0,0,0,0,0,1,0,0,0,0,0,0 !

Split is allowed only if last hour's mixing
height (m) exceeds a minimum value
(ZISPLIT)   Default: 100.   ! ZISPLIT = 100.0 !

Split is allowed only if ratio of last hour's
mixing ht to the maximum mixing ht experienced
by the puff is less than a maximum value (this
postpones a split until a nocturnal layer develops)
(ROLDMAX)   Default: 0.25   ! ROLDMAX = 0.25 !

HORIZONTAL SPLIT

Number of puffs that result every time a puff
is split - nsplith=5 means that 1 puff splits
into 5
(NSPLITH)   Default: 5   ! NSPLITH = 5 !

Minimum sigma-y (Grid Cells Units) of puff
before it may be split
(SYSPLITH)   Default: 1.0   ! SYSPLITH = 1.0 !

Minimum puff elongation rate (SYSPLITH/hr) due to
wind shear, before it may be split
(SHSPLITH)   Default: 2.   ! SHSPLITH = 2.0 !

Minimum concentration (g/m^3) of each
species in puff before it may be split
Enter array of NSPEC values; if a single value is
entered, it will be used for ALL species
(CNSPLITH) Default: 1.0E-07 ! CNSPLITH = 1.0E-07 !

Integration control variables ------------------------

Fractional convergence criterion for numerical SLUG
sampling integration
(EPSSLUG) Default: 1.0e-04 ! EPSSLUG = 1.0E-04 !

Fractional convergence criterion for numerical AREA
source integration
(EPSAREA) Default: 1.0e-06 ! EPSAREA = 1.0E-06 !

Trajectory step-length (m) used for numerical rise
integration
(DSRISE) Default: 1.0 ! DSRISE = 1.0 !

Boundary Condition (BC) Puff control variables ------------------------

Minimum height (m) to which BC puffs are mixed as they are emitted
(MBCON=2 ONLY). Actual height is reset to the current mixing height
at the release point if greater than this minimum.
(HTMINBC) Default: 500. ! HTMINBC = 500.0 !

Search radius (in BC segment lengths) about a receptor for sampling
nearest BC puff. BC puffs are emitted with a spacing of one segment
length, so the search radius should be greater than 1.
(RSAMPBC) Default: 4. ! RSAMPBC = 10.0 !

Near-Surface depletion adjustment to concentration profile used when
sampling BC puffs?
(MDEPBC) Default: 1 ! MDEPBC = 1 !
0 = Concentration is NOT adjusted for depletion
1 = Adjust Concentration for depletion

!END!

BUOYANT LINE SOURCE: CONSTANT DATA

Source No.	Beg. X Coordinate (km)	Beg. Y Coordinate (km)	End. X Coordinate (km)	End. Y Coordinate (km)	Release Height (m)	Base Elevation (m)	Emission Rates
------	----------	----------	---------	----------	-------	---------	---------

Header note: a (printed above "Release Height")

----

a
Data for each source are treated as a separate input subgroup and therefore must end with an input group terminator.

b
An emission rate must be entered for every pollutant modeled. Enter emission rate of zero for secondary pollutants that are modeled, but not emitted. Units are specified by ILNTU (e.g. 1 for g/s).

Subgroup (15c)

BUOYANT LINE SOURCE: VARIABLE EMISSIONS DATA [a]

Use this subgroup to describe temporal variations in the emission rates given in 15b. Factors entered multiply the rates in 15b. Skip sources here that have constant emissions.

IVARY determines the type of variation, and is source-specific:
(IVARY)   Default: 0
- 0 = Constant
- 1 = Diurnal cycle (24 scaling factors: hours 1-24)
- 2 = Monthly cycle (12 scaling factors: months 1-12)

3 = Hour & Season (4 groups of 24 hourly scaling factors,
where first group is DEC-JAN-FEB)
4 = Speed & Stab. (6 groups of 6 scaling factors, where
first group is Stability Class A,
and the speed classes have upper
bounds (m/s) defined in Group 12
5 = Temperature (12 scaling factors, where temperature
classes have upper bounds (C) of:
0, 5, 10, 15, 20, 25, 30, 35, 40,
45, 50, 50+)

----

----

a

Data for each receptor are treated as a separate input subgroup and therefore must end with an input group terminator.

b

Receptor height above ground is optional. If no value is entered,
the receptor is placed on the ground.

INPUT GROUP: 1 -- General run control parameters
--------------

   Option to run all periods found
   in the met. file     (METRUN)   Default: 0       ! METRUN =   0  !

       METRUN = 0 - Run period explicitly defined below
       METRUN = 1 - Run all periods in met. file

    Starting date:   Year (IBYR) -- No default       ! IBYR =  2001 !
    (used only if   Month (IBMO) -- No default       ! IBMO =   1 !
     METRUN = 0)      Day (IBDY) -- No default       ! IBDY =   1  !
                     Hour (IBHR) -- No default       ! IBHR =   0 !
```

Base time zone (XBTZ) -- No default ! XBTZ = 0.0 !
PST = 8., MST = 7.
CST = 6., EST = 5.

Length of run (hours) (IRLG) -- No default ! IRLG = 2160 !

Number of chemical species (NSPEC)
Default: 5 ! NSPEC = 6 !

Number of chemical species
to be emitted (NSE) Default: 3 ! NSE = 3 !

Flag to stop run after
SETUP phase (ITEST) Default: 2 ! ITEST = 2 !
(Used to allow checking
of the model inputs, files, etc.)
ITEST = 1 - STOPS program after SETUP phase
ITEST = 2 - Continues with execution of program
after SETUP

Restart Configuration:

Control flag (MRESTART) Default: 0 ! MRESTART = 0 !

0 = Do not read or write a restart file
1 = Read a restart file at the beginning of
the run
2 = Write a restart file during run
3 = Read a restart file at beginning of run
and write a restart file during run

Number of periods in Restart
output cycle (NRESPD) Default: 0 ! NRESPD = 0 !

0 = File written only at last period
>0 = File updated every NRESPD periods

Meteorological Data Format (METFM)
Default: 1 ! METFM = 1 !

METFM = 1 - CALMET binary file (CALMET.MET)
METFM = 2 - ISC ASCII file (ISCMET.MET)
METFM = 3 - AUSPLUME ASCII file (PLMMET.MET)
METFM = 4 - CTDM plus tower file (PROFILE.DAT) and
surface parameters file (SURFACE.DAT)

Meteorological Profile Data Format (MPRFFM)
(used only for METFM = 1, 2, 3)
Default: 1 ! MPRFFM = 1 !

MPRFFM = 1 - CTDM plus tower file (PROFILE.DAT)
MPRFFM = 2 - AERMET tower file (PROFILE.DAT)

PG sigma-y is adjusted by the factor (AVET/PGTIME)**0.2
Averaging Time (minutes) (AVET)
Default: 60.0 ! AVET = 60. !

```
    PG Averaging Time (minutes) (PGTIME)
                             Default: 60.0    ! PGTIME = 60. !

!END!

-------------------------------------------------------------------------------

INPUT GROUP: 2 -- Technical options
--------------

    Vertical distribution used in the
    near field (MGAUSS)                 Default: 1     ! MGAUSS =  1   !
       0 = uniform
       1 = Gaussian

    Terrain adjustment method
    (MCTADJ)                            Default: 3     ! MCTADJ =  3   !
       0 = no adjustment
       1 = ISC-type of terrain adjustment
       2 = simple, CALPUFF-type of terrain
           adjustment
       3 = partial plume path adjustment

    Subgrid-scale complex terrain
    flag (MCTSG)                        Default: 0     ! MCTSG =  0   !
       0 = not modeled
       1 = modeled

    Near-field puffs modeled as
    elongated 0 (MSLUG)                 Default: 0     ! MSLUG =  0   !
       0 = no
       1 = yes (slug model used)

    Transitional plume rise modeled ?
    (MTRANS)                            Default: 1     ! MTRANS =  1   !
       0 = no  (i.e., final rise only)
       1 = yes (i.e., transitional rise computed)

    Stack tip downwash? (MTIP)          Default: 1     ! MTIP =  1  !
       0 = no  (i.e., no stack tip downwash)
       1 = yes (i.e., use stack tip downwash)

    Method used to simulate building
    downwash? (MBDW)                    Default: 1     ! MBDW =   1  !
       1 = ISC method
       2 = PRIME method

    Vertical wind shear modeled above
    stack top? (MSHEAR)                 Default: 0     ! MSHEAR =  0  !
       0 = no  (i.e., vertical wind shear not modeled)
       1 = yes (i.e., vertical wind shear modeled)

    Puff splitting allowed? (MSPLIT)    Default: 0     ! MSPLIT =  0  !
```

0 = no (i.e., puffs not split)
1 = yes (i.e., puffs are split)

Chemical mechanism flag (MCHEM) Default: 1 ! MCHEM = 1 !
0 = chemical transformation not modeled
1 = transformation rates computed internally (MESOPUFF II scheme)
2 = user-specified transformation rates used
3 = transformation rates computed internally (RIVAD/ARM3 scheme)
4 = secondary organic aerosol formation computed (MESOPUFF II scheme for OH)

Aqueous phase transformation flag (MAQCHEM)
(Used only if MCHEM = 1, or 3) Default: 0 ! MAQCHEM = 0 !
0 = aqueous phase transformation not modeled
1 = transformation rates adjusted for aqueous phase reactions

Wet removal modeled ? (MWET) Default: 1 ! MWET = 1 !
0 = no
1 = yes

Dry deposition modeled ? (MDRY) Default: 1 ! MDRY = 1 !
0 = no
1 = yes
(dry deposition method specified for each species in Input Group 3)

Method used to compute dispersion
coefficients (MDISP) Default: 3 ! MDISP = 3 !

1 = dispersion coefficients computed from measured values of turbulence, sigma v, sigma w
2 = dispersion coefficients from internally calculated sigma v, sigma w using micrometeorological variables (u*, w*, L, etc.)
3 = PG dispersion coefficients for RURAL areas (computed using the ISCST multi-segment approximation) and MP coefficients in urban areas
4 = same as 3 except PG coefficients computed using the MESOPUFF II eqns.
5 = CTDM sigmas used for stable and neutral conditions. For unstable conditions, sigmas are computed as in MDISP = 3, described above. MDISP = 5 assumes that measured values are read

Sigma-v/sigma-theta, sigma-w measurements used? (MTURBVW)
(Used only if MDISP = 1 or 5) Default: 3 ! MTURBVW = 3 !
1 = use sigma-v or sigma-theta measurements from PROFILE.DAT to compute sigma-y (valid for METFM = 1, 2, 3, 4)
2 = use sigma-w measurements

from PROFILE.DAT to compute sigma-z
(valid for METFM = 1, 2, 3, 4)
3 = use both sigma-(v/theta) and sigma-w
from PROFILE.DAT to compute sigma-y and sigma-z
(valid for METFM = 1, 2, 3, 4)
4 = use sigma-theta measurements
from PLMMET.DAT to compute sigma-y
(valid only if METFM = 3)

Back-up method used to compute dispersion
when measured turbulence data are
missing (MDISP2)   Default: 3   ! MDISP2 = 3 !
(used only if MDISP = 1 or 5)
2 = dispersion coefficients from internally calculated
sigma v, sigma w using micrometeorological variables
(u*, w*, L, etc.)
3 = PG dispersion coefficients for RURAL areas (computed using
the ISCST multi-segment approximation) and MP coefficients in
urban areas
4 = same as 3 except PG coefficients computed using
the MESOPUFF II eqns.

[DIAGNOSTIC FEATURE]
Method used for Lagrangian timescale for Sigma-y
(used only if MDISP=1,2 or MDISP2=1,2)
(MTAULY)   Default: 0   ! MTAULY = 0 !
0 = Draxler default 617.284 (s)
1 = Computed as Lag. Length / (.75 q) -- after SCIPUFF
10 < Direct user input (s)   -- e.g., 306.9

[DIAGNOSTIC FEATURE]
Method used for Advective-Decay timescale for Turbulence
(used only if MDISP=2 or MDISP2=2)
(MTAUADV)   Default: 0   ! MTAUADV = 0 !
0 = No turbulence advection
1 = Computed (OPTION NOT IMPLEMENTED)
10 < Direct user input (s)   -- e.g., 300

Method used to compute turbulence sigma-v &
sigma-w using micrometeorological variables
(Used only if MDISP = 2 or MDISP2 = 2)
(MCTURB)   Default: 1   ! MCTURB = 1 !
1 = Standard CALPUFF subroutines
2 = AERMOD subroutines

PG sigma-y,z adj. for roughness?   Default: 0   ! MROUGH = 0 !
(MROUGH)
0 = no
1 = yes

Partial plume penetration of   Default: 1   ! MPARTL = 1 !
elevated inversion?
(MPARTL)
0 = no

1 = yes

Strength of temperature inversion Default: 0 ! MTINV = 0 !
provided in PROFILE.DAT extended records?
(MTINV)
0 = no (computed from measured/default gradients)
1 = yes

PDF used for dispersion under convective conditions?
Default: 0 ! MPDF = 0 !
(MPDF)
0 = no
1 = yes

Sub-Grid TIBL module used for shore line?
Default: 0 ! MSGTIBL = 0 !
(MSGTIBL)
0 = no
1 = yes

Boundary conditions (concentration) modeled?
Default: 0 ! MBCON = 0 !
(MBCON)
0 = no
1 = yes, using formatted BCON.DAT file
2 = yes, using unformatted CONC.DAT file

Analyses of fogging and icing impacts due to emissions from arrays of mechanically-forced cooling towers can be performed using CALPUFF in conjunction with a cooling tower emissions processor (CTEMISS) and its associated postprocessors. Hourly emissions of water vapor and temperature from each cooling tower cell are computed for the current cell configuration and ambient conditions by CTEMISS. CALPUFF models the dispersion of these emissions and provides cloud information in a specialized format for further analysis. Output to FOG.DAT is provided in either 'plume mode' or 'receptor mode' format.

Configure for FOG Model output?
Default: 0 ! MFOG = 0 !
(MFOG)
0 = no
1 = yes - report results in PLUME Mode format
2 = yes - report results in RECEPTOR Mode format

Subgroup (3b)

The following names are used for Species-Groups in which results
for certain species are combined (added) prior to output. The
CGRUP name will be used as the species name in output files.
Use this feature to model specific particle-size distributions
by treating each size-range as a separate species.
Order must be consistent with 3(a) above.

INPUT GROUP: 4 -- Map Projection and Grid control parameters

Projection for all (X,Y):

Map projection
(PMAP) Default: UTM ! PMAP = LCC !

UTM : Universal Transverse Mercator
TTM : Tangential Transverse Mercator
LCC : Lambert Conformal Conic
PS : Polar Stereographic
EM : Equatorial Mercator
LAZA : Lambert Azimuthal Equal Area

False Easting and Northing (km) at the projection origin
(Used only if PMAP= TTM, LCC, or LAZA)
(FEAST) Default=0.0 ! FEAST = 0.000 !
(FNORTH) Default=0.0 ! FNORTH = 0.000 !

UTM zone (1 to 60)
(Used only if PMAP=UTM)
(IUTMZN) No Default ! IUTMZN = 15 !

Hemisphere for UTM projection?
(Used only if PMAP=UTM)
(UTMHEM) Default: N ! UTMHEM = N !
N : Northern hemisphere projection
S : Southern hemisphere projection

Latitude and Longitude (decimal degrees) of projection origin
(Used only if PMAP= TTM, LCC, PS, EM, or LAZA)
(RLAT0) No Default ! RLAT0 = 40N !
(RLON0) No Default ! RLON0 = 97W !

TTM : RLON0 identifies central (true N/S) meridian of projection
RLAT0 selected for convenience
LCC : RLON0 identifies central (true N/S) meridian of projection
RLAT0 selected for convenience
PS : RLON0 identifies central (grid N/S) meridian of projection
RLAT0 selected for convenience
EM : RLON0 identifies central meridian of projection

RLAT0 is REPLACED by 0.0N (Equator)
LAZA: RLON0 identifies longitude of tangent-point of mapping plane
RLAT0 identifies latitude of tangent-point of mapping plane

Matching parallel(s) of latitude (decimal degrees) for projection
(Used only if PMAP= LCC or PS)
(XLAT1) No Default ! XLAT1 = 33N !
(XLAT2) No Default ! XLAT2 = 45N !

LCC : Projection cone slices through Earth's surface at XLAT1 and XLAT2
PS : Projection plane slices through Earth at XLAT1
(XLAT2 is not used)

Note: Latitudes and longitudes should be positive, and include a
letter N,S,E, or W indicating north or south latitude, and
east or west longitude. For example,
35.9 N Latitude = 35.9N
118.7 E Longitude = 118.7E

Datum-region

The Datum-Region for the coordinates is identified by a character string. Many mapping products currently available use the model of the Earth known as the World Geodetic System 1984 (WGS-G). Other local models may be in use, and their selection in CALMET will make its output consistent with local mapping products. The list of Datum-Regions with official transformation parameters is provided by the National Imagery and Mapping Agency (NIMA).

NIMA Datum - Regions(Examples)

WGS-G WGS-84 GRS 80 Spheroid, Global coverage (WGS84)
NAS-C NORTH AMERICAN 1927 Clarke 1866 Spheroid, MEAN FOR CONUS (NAD27)
NWS-27 NWS 6370KM Radius, Sphere
NWS-84 NWS 6370KM Radius, Sphere
ESR-S ESRI REFERENCE 6371KM Radius, Sphere

Datum-region for output coordinates
(DATUM) Default: WGS-G ! DATUM = WGS-G !

METEOROLOGICAL Grid:

Rectangular grid defined for projection PMAP,
with X the Easting and Y the Northing coordinate

No. X grid cells (NX) No default ! NX = 366 !
No. Y grid cells (NY) No default ! NY = 234 !
No. vertical layers (NZ) No default ! NZ = 10 !

Grid spacing (DGRIDKM) No default ! DGRIDKM = 6 !
Units: km

```
            Cell face heights
               (ZFACE(nz+1))      No defaults
                              Units: m
  ! ZFACE = 0., 20., 40., 80., 160., 320., 640., 1200., 2000., 3000.,
          4000. !

         Reference Coordinates
        of SOUTHWEST corner of
            grid cell(1, 1):

         X-coordinate (XORIGKM)     No default     ! XORIGKM = -1008. !
         Y coordinate (YORIGKM)     No default     ! YORIGKM = -864. !
                             Units: km
```

COMPUTATIONAL Grid:

The computational grid is identical to or a subset of the MET. grid.
The lower left (LL) corner of the computational grid is at grid point
(IBCOMP, JBCOMP) of the MET. grid. The upper right (UR) corner of the
computational grid is at grid point (IECOMP, JECOMP) of the MET. grid.
The grid spacing of the computational grid is the same as the MET. grid.

```
  X index of LL corner (IBCOMP)      No default     ! IBCOMP =  168   !
         (1 <= IBCOMP <= NX)

  Y index of LL corner (JBCOMP)      No default     ! JBCOMP =  24   !
         (1 <= JBCOMP <= NY)

  X index of UR corner (IECOMP)      No default     ! IECOMP =  320   !
         (1 <= IECOMP <= NX)

  Y index of UR corner (JECOMP)      No default     ! JECOMP =  168   !
         (1 <= JECOMP <= NY)
```

SAMPLING Grid (GRIDDED RECEPTORS):

The lower left (LL) corner of the sampling grid is at grid point
(IBSAMP, JBSAMP) of the MET. grid. The upper right (UR) corner of the
sampling grid is at grid point (IESAMP, JESAMP) of the MET. grid.
The sampling grid must be identical to or a subset of the computational
grid. It may be a nested grid inside the computational grid.
The grid spacing of the sampling grid is DGRIDKM/MESHDN.

```
  Logical flag indicating if gridded
  receptors are used (LSAMP)        Default: T     ! LSAMP = F !
  (T=yes, F=no)

  X index of LL corner (IBSAMP)      No default     ! IBSAMP =  1   !
   (IBCOMP <= IBSAMP <= IECOMP)

  Y index of LL corner (JBSAMP)      No default     ! JBSAMP =  1   !
   (JBCOMP <= JBSAMP <= JECOMP)
```

```
     X index of UR corner (IESAMP)      No default     ! IESAMP =  251   !
      (IBCOMP <= IESAMP <= IECOMP)

     Y index of UR corner (JESAMP)      No default     ! JESAMP =  246   !
      (JBCOMP <= JESAMP <= JECOMP)

    Nesting factor of the sampling
     grid (MESHDN)                      Default: 1     ! MESHDN =  1  !
     (MESHDN is an integer >= 1)

!END!

COMPLEX TERRAIN RECEPTOR INFORMATION

XRCT	YRCT	ZRCT	XHH
(km)	(km)	(m)	
------	-----	------	----

1
Description of Complex Terrain Variables:
XC, YC = Coordinates of center of hill
THETAH = Orientation of major axis of hill (clockwise from North)
ZGRID = Height of the 0 of the grid above mean sea level
RELIEF = Height of the crest of the hill above the grid elevation
EXPO 1 = Hill-shape exponent for the major axis
EXPO 2 = Hill-shape exponent for the major axis
SCALE 1 = Horizontal length scale along the major axis
SCALE 2 = Horizontal length scale along the minor axis
AMAX = Maximum allowed axis length for the major axis
BMAX = Maximum allowed axis length for the major axis

XRCT, YRCT = Coordinates of the complex terrain receptors
ZRCT = Height of the ground (MSL) at the complex terrain Receptor
XHH = Hill number associated with each complex terrain receptor (NOTE: MUST BE ENTERED AS A REAL NUMBER)

**
NOTE: DATA for each hill and CTSG receptor are treated as a separate input subgroup and therefore must end with an input group terminator.

INPUT GROUP: 7 -- Chemical parameters for dry deposition of gases

!END!

INPUT GROUP: 8 -- Size parameters for dry deposition of particles
----

For SINGLE SPECIES, the mean and standard deviation are used to
compute a deposition velocity for NINT (see group 9) size-ranges,
and these are then averaged to obtain a mean deposition velocity.

For GROUPED SPECIES, the size distribution should be explicitly
specified (by the 'species' in the group), and the standard deviation
for each should be entered as 0. The model will then use the
deposition velocity for the stated mean diameter.

```
      SPECIES      GEOMETRIC MASS MEAN       GEOMETRIC STANDARD
       NAME            DIAMETER                 DEVIATION

    Site characterization parameters for single-point Met data files ---------
    (needed for METFM = 2,3,4)

      Land use category for modeling domain
      (ILANDUIN)                        Default: 20     ! ILANDUIN =  20  !

      Roughness length (m) for modeling domain
      (Z0IN)                            Default: 0.25   ! Z0IN = .25 !

      Leaf area index for modeling domain
      (XLAIIN)                          Default: 3.0    ! XLAIIN = 3.0 !

      Elevation above sea level (m)
      (ELEVIN)                          Default: 0.0    ! ELEVIN = .0 !
```

Latitude (degrees) for met location
(XLATIN) Default: -999. ! XLATIN = -999.0 !

Longitude (degrees) for met location
(XLONIN) Default: -999. ! XLONIN = -999.0 !

Specialized information for interpreting single-point Met data files -----

Anemometer height (m) (Used only if METFM = 2,3)
(ANEMHT) Default: 10. ! ANEMHT = 10.0 !

Form of lateral turbulance data in PROFILE.DAT file
(Used only if METFM = 4 or MTURBVW = 1 or 3)
(ISIGMAV) Default: 1 ! ISIGMAV = 1 !
0 = read sigma-theta
1 = read sigma-v

Choice of mixing heights (Used only if METFM = 4)
(IMIXCTDM) Default: 0 ! IMIXCTDM = 0 !
0 = read PREDICTED mixing heights
1 = read OBSERVED mixing heights

Maximum length of a slug (met. grid units)
(XMXLEN) Default: 1.0 ! XMXLEN = 1.0 !

Maximum travel distance of a puff/slug (in
grid units) during one sampling step
(XSAMLEN) Default: 1.0 ! XSAMLEN = 1.0 !

Maximum Number of slugs/puffs release from
one source during one time step
(MXNEW) Default: 99 ! MXNEW = 99 !

Maximum Number of sampling steps for
one puff/slug during one time step
(MXSAM) Default: 99 ! MXSAM = 99 !

Number of iterations used when computing
the transport wind for a sampling step
that includes gradual rise (for CALMET
and PROFILE winds)
(NCOUNT) Default: 2 ! NCOUNT = 2 !

Minimum sigma y for a new puff/slug (m)
(SYMIN) Default: 1.0 ! SYMIN = 1.0 !

Minimum sigma z for a new puff/slug (m)
(SZMIN) Default: 1.0 ! SZMIN = 1.0 !

Default minimum turbulence velocities sigma-v and sigma-w
for each stability class over land and over water (m/s)
(SVMIN(12) and SWMIN(12))

```
           ----------  LAND  ----------      ---------  WATER  ----------
  Stab Class :  A    B    C    D    E    F       A    B    C    D    E    F
           ---  ---  ---  ---  ---  ---      ---  ---  ---  ---  ---  ---
```

Default SVMIN : .50, .50, .50, .50, .50, .50,   .37, .37, .37, .37, .37, .37
Default SWMIN : .20, .12, .08, .06, .03, .016,   .20, .12, .08, .06, .03, .016

! SVMIN = 0.500, 0.500, 0.500, 0.500, 0.500, 0.500, 0.370, 0.370, 0.370, 0.370, 0.370, 0.370!
! SWMIN = 0.200, 0.120, 0.080, 0.060, 0.030, 0.016, 0.200, 0.120, 0.080, 0.060, 0.030, 0.016!

Divergence criterion for dw/dz across puff
used to initiate adjustment for horizontal
convergence (1/s)
Partial adjustment starts at CDIV(1), and
full adjustment is reached at CDIV(2)
(CDIV(2))   Default: 0.0,0.0 ! CDIV = .0, .0 !

Minimum wind speed (m/s) allowed for
non-calm conditions. Also used as minimum
speed returned when using power-law
extrapolation toward surface
(WSCALM)   Default: 0.5   ! WSCALM = .5 !

Maximum mixing height (m)
(XMAXZI)   Default: 3000. ! XMAXZI = 4000.0 !

Minimum mixing height (m)
(XMINZI)   Default: 50.   ! XMINZI = 20.0 !

Default wind speed classes --
5 upper bounds (m/s) are entered;
the 6th class has no upper limit
(WSCAT(5))   Default   :
ISC RURAL : 1.54, 3.09, 5.14, 8.23, 10.8 (10.8+)

Wind Speed Class : 1   2   3   4   5
--- --- --- --- ---
! WSCAT = 1.54, 3.09, 5.14, 8.23, 10.80 !

Default wind speed profile power-law
exponents for stabilities 1-6
(PLX0(6))   Default   : ISC RURAL values
ISC RURAL : .07, .07, .10, .15, .35, .55
ISC URBAN : .15, .15, .20, .25, .30, .30

Stability Class : A   B   C   D   E   F
--- --- --- --- --- ---
! PLX0 = 0.07, 0.07, 0.10, 0.15, 0.35, 0.55 !

Default potential temperature gradient
for stable classes E, F (degK/m)
(PTG0(2))   Default: 0.020, 0.035
! PTG0 = 0.020,   0.035 !

Default plume path coefficients for
each stability class (used when option
for partial plume height terrain adjustment
is selected -- MCTADJ=3)
(PPC(6))   Stability Class : A   B   C   D   E   F

Default PPC : .50, .50, .50, .50, .35, .35
--- --- --- --- --- ---
! PPC = 0.50, 0.50, 0.50, 0.50, 0.35, 0.35 !

Slug-to-puff transition criterion factor
equal to sigma-y/length of slug
(SL2PF)   Default: 10.   ! SL2PF = 10.0 !

Puff-splitting control variables ------------------------

VERTICAL SPLIT

Number of puffs that result every time a puff
is split - nsplit=2 means that 1 puff splits
into 2
(NSPLIT)   Default: 3   ! NSPLIT = 3 !

Time(s) of a day when split puffs are eligible to
be split once again; this is typically set once
per day, around sunset before nocturnal shear develops.
24 values: 0 is midnight (00:00) and 23 is 11 PM (23:00)
0=do not re-split   1=eligible for re-split
(IRESPLIT(24))   Default: Hour 17 = 1
! IRESPLIT = 0,0,0,0,0,0,0,0,0,0,0,0,0,0,0,0,0,1,0,0,0,0,0,0 !

Split is allowed only if last hour's mixing
height (m) exceeds a minimum value
(ZISPLIT)   Default: 100.   ! ZISPLIT = 100.0 !

Split is allowed only if ratio of last hour's
mixing ht to the maximum mixing ht experienced
by the puff is less than a maximum value (this
postpones a split until a nocturnal layer develops)
(ROLDMAX)   Default: 0.25   ! ROLDMAX = 0.25 !

HORIZONTAL SPLIT

Number of puffs that result every time a puff
is split - nsplith=5 means that 1 puff splits
into 5
(NSPLITH)   Default: 5   ! NSPLITH = 5 !

Minimum sigma-y (Grid Cells Units) of puff
before it may be split
(SYSPLITH)   Default: 1.0   ! SYSPLITH = 1.0 !

Minimum puff elongation rate (SYSPLITH/hr) due to
wind shear, before it may be split
(SHSPLITH)   Default: 2.   ! SHSPLITH = 2.0 !

Minimum concentration (g/m^3) of each
species in puff before it may be split
Enter array of NSPEC values; if a single value is

entered, it will be used for ALL species
(CNSPLITH) Default: 1.0E-07 ! CNSPLITH = 1.0E-07 !

Integration control variables ------------------------

Fractional convergence criterion for numerical SLUG
sampling integration
(EPSSLUG) Default: 1.0e-04 ! EPSSLUG = 1.0E-04 !

Fractional convergence criterion for numerical AREA
source integration
(EPSAREA) Default: 1.0e-06 ! EPSAREA = 1.0E-06 !

Trajectory step-length (m) used for numerical rise
integration
(DSRISE) Default: 1.0 ! DSRISE = 1.0 !

Boundary Condition (BC) Puff control variables ------------------------

Minimum height (m) to which BC puffs are mixed as they are emitted
(MBCON=2 ONLY). Actual height is reset to the current mixing height
at the release point if greater than this minimum.
(HTMINBC) Default: 500. ! HTMINBC = 500.0 !

Search radius (in BC segment lengths) about a receptor for sampling
nearest BC puff. BC puffs are emitted with a spacing of one segment
length, so the search radius should be greater than 1.
(RSAMPBC) Default: 4. ! RSAMPBC = 10.0 !

Near-Surface depletion adjustment to concentration profile used when
sampling BC puffs?
(MDEPBC) Default: 1 ! MDEPBC = 1 !
0 = Concentration is NOT adjusted for depletion
1 = Adjust Concentration for depletion

!END!

INPUT GROUPS: 13a, 13b, 13c, 13d -- Point source parameters

Subgroup (13a)

--------

    a
     Data for each source are treated as a separate input subgroup
     and therefore must end with an input group terminator.

     SRCNAM  is a 12-character name for a source
             (No default)
     X       is an array holding the source data listed by the column headings
             (No default)
     SIGYZI  is an array holding the initial sigma-y and sigma-z (m)
             (Default: 0.,0.)
     FMFAC   is a vertical momentum flux factor (0. or 1.0) used to represent
             the effect of rain-caps or other physical configurations that
             reduce momentum rise associated with the actual exit velocity.
             (Default: 1.0  -- full momentum used)

    b
     0. = No building downwash modeled, 1. = downwash modeled
     NOTE: must be entered as a REAL number (i.e., with decimal point)
```

c
An emission rate must be entered for every pollutant modeled. Enter emission rate of zero for secondary pollutants that are modeled, but not emitted. Units are specified by IPTU (e.g. 1 for g/s).

Subgroup (13c)

BUILDING DIMENSION DATA FOR SOURCES SUBJECT TO DOWNWASH

Source No. — Effective building height, width, length and X/Y offset (in meters)[a] every 10 degrees. LENGTH, XBADJ, and YBADJ are only needed for MBDW=2 (PRIME downwash option)

------ --

----

a
Building height, width, length, and X/Y offset from the source are treated as a separate input subgroup for each source and therefore must end with an input group terminator. The X/Y offset is the position, relative to the stack, of the center of the upwind face of the projected building, with the x-axis pointing along the flow direction.

Subgroup (13d)

POINT SOURCE: VARIABLE EMISSIONS DATA[a]

Use this subgroup to describe temporal variations in the emission rates given in 13b. Factors entered multiply the rates in 13b. Skip sources here that have constant emissions. For more elaborate variation in source parameters, use PTEMARB.DAT and NPT2 > 0.

IVARY determines the type of variation, and is source-specific:
(IVARY) Default: 0

- 0 = Constant
- 1 = Diurnal cycle (24 scaling factors: hours 1-24)
- 2 = Monthly cycle (12 scaling factors: months 1-12)
- 3 = Hour & Season (4 groups of 24 hourly scaling factors, where first group is DEC-JAN-FEB)
- 4 = Speed & Stab. (6 groups of 6 scaling factors, where first group is Stability Class A, and the speed classes have upper bounds (m/s) defined in Group 12
- 5 = Temperature (12 scaling factors, where temperature classes have upper bounds (C) of: 0, 5, 10, 15, 20, 25, 30, 35, 40, 45, 50, 50+)

----

a
Data for each receptor are treated as a separate input subgroup and therefore must end with an input group terminator.

b
Receptor height above ground is optional. If no value is entered, the receptor is placed on the ground.

INPUT GROUP: 1 -- General run control parameters

Option to run all periods found
in the met. file (METRUN) Default: 0 ! METRUN = 0 !

METRUN = 0 - Run period explicitly defined below
METRUN = 1 - Run all periods in met. file

Starting date: Year (IBYR) -- No default ! IBYR = 2001 !
(used only if Month (IBMO) -- No default ! IBMO = 03 !
METRUN = 0) Day (IBDY) -- No default ! IBDY = 28 !
Hour (IBHR) -- No default ! IBHR = 0 !

Base time zone   (XBTZ) -- No default   ! XBTZ = 0.0 !
PST = 8., MST = 7.
CST = 6., EST = 5.

Length of run (hours) (IRLG) -- No default   ! IRLG = 2280 !

Number of chemical species (NSPEC)
Default: 5   ! NSPEC = 7   !

Number of chemical species
to be emitted (NSE)   Default: 3   ! NSE = 4   !

Flag to stop run after
SETUP phase (ITEST)   Default: 2   ! ITEST = 2   !
(Used to allow checking
of the model inputs, files, etc.)
ITEST = 1 - STOPS program after SETUP phase
ITEST = 2 - Continues with execution of program
after SETUP

Restart Configuration:

Control flag (MRESTART)   Default: 0   ! MRESTART = 0   !

0 = Do not read or write a restart file
1 = Read a restart file at the beginning of
the run
2 = Write a restart file during run
3 = Read a restart file at beginning of run
and write a restart file during run

Number of periods in Restart
output cycle (NRESPD)   Default: 0   ! NRESPD = 0   !

0 = File written only at last period
>0 = File updated every NRESPD periods

Meteorological Data Format (METFM)
Default: 1   ! METFM = 1   !

METFM = 1 - CALMET binary file (CALMET.MET)
METFM = 2 - ISC ASCII file (ISCMET.MET)
METFM = 3 - AUSPLUME ASCII file (PLMMET.MET)
METFM = 4 - CTDM plus tower file (PROFILE.DAT) and
surface parameters file (SURFACE.DAT)

Meteorological Profile Data Format (MPRFFM)
(used only for METFM = 1, 2, 3)
Default: 1   ! MPRFFM = 1   !

MPRFFM = 1 - CTDM plus tower file (PROFILE.DAT)
MPRFFM = 2 - AERMET tower file (PROFILE.DAT)

PG sigma-y is adjusted by the factor (AVET/PGTIME)**0.2
Averaging Time (minutes) (AVET)
Default: 60.0   ! AVET = 60. !

```
    PG Averaging Time (minutes) (PGTIME)
                              Default: 60.0    ! PGTIME = 60. !

!END!

-------------------------------------------------------------------------------

INPUT GROUP: 2 -- Technical options
--------------

    Vertical distribution used in the
    near field (MGAUSS)               Default: 1     ! MGAUSS =  1   !
      0 = uniform
      1 = Gaussian

    Terrain adjustment method
    (MCTADJ)                          Default: 3     ! MCTADJ =  3   !
      0 = no adjustment
      1 = ISC-type of terrain adjustment
      2 = simple, CALPUFF-type of terrain
          adjustment
      3 = partial plume path adjustment

    Subgrid-scale complex terrain
    flag (MCTSG)                      Default: 0     ! MCTSG =  0   !
      0 = not modeled
      1 = modeled

    Near-field puffs modeled as
    elongated 0 (MSLUG)               Default: 0     ! MSLUG =  0   !
      0 = no
      1 = yes (slug model used)

    Transitional plume rise modeled ?
    (MTRANS)                          Default: 1     ! MTRANS =  1   !
      0 = no  (i.e., final rise only)
      1 = yes (i.e., transitional rise computed)

    Stack tip downwash? (MTIP)        Default: 1     ! MTIP =  1  !
      0 = no  (i.e., no stack tip downwash)
      1 = yes (i.e., use stack tip downwash)

    Method used to simulate building
    downwash? (MBDW)                  Default: 1     ! MBDW =   1  !
      1 = ISC method
      2 = PRIME method

    Vertical wind shear modeled above
    stack top? (MSHEAR)               Default: 0     ! MSHEAR =  0  !
      0 = no  (i.e., vertical wind shear not modeled)
      1 = yes (i.e., vertical wind shear modeled)

    Puff splitting allowed? (MSPLIT)  Default: 0     ! MSPLIT =  0  !
```

0 = no (i.e., puffs not split)
1 = yes (i.e., puffs are split)

Chemical mechanism flag (MCHEM)   Default: 1   ! MCHEM = 1 !
0 = chemical transformation not modeled
1 = transformation rates computed internally (MESOPUFF II scheme)
2 = user-specified transformation rates used
3 = transformation rates computed internally (RIVAD/ARM3 scheme)
4 = secondary organic aerosol formation computed (MESOPUFF II scheme for OH)

Aqueous phase transformation flag (MAQCHEM)
(Used only if MCHEM = 1, or 3)   Default: 0   ! MAQCHEM = 0 !
0 = aqueous phase transformation not modeled
1 = transformation rates adjusted for aqueous phase reactions

Wet removal modeled ? (MWET)   Default: 1   ! MWET = 1 !
0 = no
1 = yes

Dry deposition modeled ? (MDRY)   Default: 1   ! MDRY = 1 !
0 = no
1 = yes
(dry deposition method specified for each species in Input Group 3)

Method used to compute dispersion
coefficients (MDISP)   Default: 3   ! MDISP = 3 !

1 = dispersion coefficients computed from measured values of turbulence, sigma v, sigma w
2 = dispersion coefficients from internally calculated sigma v, sigma w using micrometeorological variables (u*, w*, L, etc.)
3 = PG dispersion coefficients for RURAL areas (computed using the ISCST multi-segment approximation) and MP coefficients in urban areas
4 = same as 3 except PG coefficients computed using the MESOPUFF II eqns.
5 = CTDM sigmas used for stable and neutral conditions. For unstable conditions, sigmas are computed as in MDISP = 3, described above. MDISP = 5 assumes that measured values are read

Sigma-v/sigma-theta, sigma-w measurements used? (MTURBVW)
(Used only if MDISP = 1 or 5)   Default: 3   ! MTURBVW = 3 !
1 = use sigma-v or sigma-theta measurements from PROFILE.DAT to compute sigma-y (valid for METFM = 1, 2, 3, 4)
2 = use sigma-w measurements

from PROFILE.DAT to compute sigma-z
(valid for METFM = 1, 2, 3, 4)
3 = use both sigma-(v/theta) and sigma-w
from PROFILE.DAT to compute sigma-y and sigma-z
(valid for METFM = 1, 2, 3, 4)
4 = use sigma-theta measurements
from PLMMET.DAT to compute sigma-y
(valid only if METFM = 3)

Back-up method used to compute dispersion
when measured turbulence data are
missing (MDISP2) Default: 3 ! MDISP2 = 3 !
(used only if MDISP = 1 or 5)
2 = dispersion coefficients from internally calculated
sigma v, sigma w using micrometeorological variables
(u*, w*, L, etc.)
3 = PG dispersion coefficients for RURAL areas (computed using
the ISCST multi-segment approximation) and MP coefficients in
urban areas
4 = same as 3 except PG coefficients computed using
the MESOPUFF II eqns.

[DIAGNOSTIC FEATURE]
Method used for Lagrangian timescale for Sigma-y
(used only if MDISP=1,2 or MDISP2=1,2)
(MTAULY) Default: 0 ! MTAULY = 0 !
0 = Draxler default 617.284 (s)
1 = Computed as Lag. Length / (.75 q) -- after SCIPUFF
10 < Direct user input (s) -- e.g., 306.9

[DIAGNOSTIC FEATURE]
Method used for Advective-Decay timescale for Turbulence
(used only if MDISP=2 or MDISP2=2)
(MTAUADV) Default: 0 ! MTAUADV = 0 !
0 = No turbulence advection
1 = Computed (OPTION NOT IMPLEMENTED)
10 < Direct user input (s) -- e.g., 300

Method used to compute turbulence sigma-v &
sigma-w using micrometeorological variables
(Used only if MDISP = 2 or MDISP2 = 2)
(MCTURB) Default: 1 ! MCTURB = 1 !
1 = Standard CALPUFF subroutines
2 = AERMOD subroutines

PG sigma-y,z adj. for roughness? Default: 0 ! MROUGH = 0 !
(MROUGH)
0 = no
1 = yes

Partial plume penetration of Default: 1 ! MPARTL = 1 !
elevated inversion?
(MPARTL)
0 = no

1 = yes

Strength of temperature inversion   Default: 0   ! MTINV = 0 !
provided in PROFILE.DAT extended records?

Sub-Grid TIBL module used for shore line?
Default: 0   ! MSGTIBL = 0 !
(MSGTIBL)
0 = no
1 = yes

Boundary conditions (concentration) modeled?
Default: 0   ! MBCON = 0 !
(MBCON)
0 = no
1 = yes, using formatted BCON.DAT file
2 = yes, using unformatted CONC.DAT file

Analyses of fogging and icing impacts due to emissions from arrays of mechanically-forced cooling towers can be performed using CALPUFF in conjunction with a cooling tower emissions processor (CTEMISS) and its associated postprocessors. Hourly emissions of water vapor and temperature from each cooling tower cell are computed for the current cell configuration and ambient conditions by CTEMISS. CALPUFF models the dispersion of these emissions and provides cloud information in a specialized format for further analysis. Output to FOG.DAT is provided in either 'plume mode' or 'receptor mode' format.

Configure for FOG Model output?
Default: 0   ! MFOG = 0   !
(MFOG)
0 = no
1 = yes - report results in PLUME Mode format
2 = yes - report results in RECEPTOR Mode format

Test options specified to see if
they conform to regulatory
values? (MREG)   Default: 1   ! MREG = 1   !

0 = NO checks are made
1 = Technical options must conform to USEPA
Long Range Transport (LRT) guidance

Subgroup (3b)
-------------
  The following names are used for Species-Groups in which results
  for certain species are combined (added) prior to output.  The
  CGRUP name will be used as the species name in output files.
  Use this feature to model specific particle-size distributions
  by treating each size-range as a separate species.
  Order must be consistent with 3(a) above.

------------------------------------------------------------------------------

INPUT GROUP: 4 -- Map Projection and Grid control parameters
--------------

     Projection for all (X,Y):
     -------------------------

     Map projection
     (PMAP)                  Default: UTM    ! PMAP = LCC  !

         UTM :  Universal Transverse Mercator
         TTM :  Tangential Transverse Mercator
         LCC :  Lambert Conformal Conic
          PS :  Polar Stereographic
          EM :  Equatorial Mercator
        LAZA :  Lambert Azimuthal Equal Area

     False Easting and Northing (km) at the projection origin
     (Used only if PMAP= TTM, LCC, or LAZA)
     (FEAST)                 Default=0.0     ! FEAST  = 0.000  !
     (FNORTH)                Default=0.0     ! FNORTH = 0.000  !

     UTM zone (1 to 60)
     (Used only if PMAP=UTM)
     (IUTMZN)                No Default      ! IUTMZN =  15   !

     Hemisphere for UTM projection?
     (Used only if PMAP=UTM)
     (UTMHEM)                Default: N      ! UTMHEM = N  !
         N   :  Northern hemisphere projection
         S   :  Southern hemisphere projection

     Latitude and Longitude (decimal degrees) of projection origin
     (Used only if PMAP= TTM, LCC, PS, EM, or LAZA)
     (RLAT0)                 No Default      ! RLAT0 = 40N  !
     (RLON0)                 No Default      ! RLON0 = 97W  !

         TTM :  RLON0 identifies central (true N/S) meridian of projection
                RLAT0 selected for convenience
         LCC :  RLON0 identifies central (true N/S) meridian of projection
                RLAT0 selected for convenience
         PS  :  RLON0 identifies central (grid N/S) meridian of projection
```

RLAT0 selected for convenience
EM : RLON0 identifies central meridian of projection
RLAT0 is REPLACED by 0.0N (Equator)
LAZA: RLON0 identifies longitude of tangent-point of mapping plane
RLAT0 identifies latitude of tangent-point of mapping plane

Matching parallel(s) of latitude (decimal degrees) for projection
(Used only if PMAP= LCC or PS)
(XLAT1) No Default ! XLAT1 = 33N !
(XLAT2) No Default ! XLAT2 = 45N !

LCC : Projection cone slices through Earth's surface at XLAT1 and XLAT2
PS : Projection plane slices through Earth at XLAT1
(XLAT2 is not used)

Note: Latitudes and longitudes should be positive, and include a
letter N,S,E, or W indicating north or south latitude, and
east or west longitude. For example,
35.9 N Latitude = 35.9N
118.7 E Longitude = 118.7E

Datum-region

The Datum-Region for the coordinates is identified by a character string. Many mapping products currently available use the model of the Earth known as the World Geodetic System 1984 (WGS-G). Other local models may be in use, and their selection in CALMET will make its output consistent with local mapping products. The list of Datum-Regions with official transformation parameters is provided by the National Imagery and Mapping Agency (NIMA).

NIMA Datum - Regions(Examples)

WGS-G WGS-84 GRS 80 Spheroid, Global coverage (WGS84)
NAS-C NORTH AMERICAN 1927 Clarke 1866 Spheroid, MEAN FOR CONUS (NAD27)
NWS-27 NWS 6370KM Radius, Sphere
NWS-84 NWS 6370KM Radius, Sphere
ESR-S ESRI REFERENCE 6371KM Radius, Sphere

Datum-region for output coordinates
(DATUM) Default: WGS-G ! DATUM = WGS-G !

METEOROLOGICAL Grid:

Rectangular grid defined for projection PMAP,
with X the Easting and Y the Northing coordinate

No. X grid cells (NX) No default ! NX = 366 !
No. Y grid cells (NY) No default ! NY = 234 !
No. vertical layers (NZ) No default ! NZ = 10 !

Grid spacing (DGRIDKM) No default ! DGRIDKM = 6 !

Units: km

Cell face heights
(ZFACE(nz+1)) No defaults
Units: m
! ZFACE = 0., 20., 40., 80., 160., 320., 640., 1200., 2000., 3000.,
4000. !

Reference Coordinates
of SOUTHWEST corner of
grid cell(1, 1):

X-coordinate (XORIGKM) No default ! XORIGKM = -1008. !
Y coordinate (YORIGKM) No default ! YORIGKM = -864. !
Units: km

COMPUTATIONAL Grid:

The computational grid is identical to or a subset of the MET. grid.
The lower left (LL) corner of the computational grid is at grid point
(IBCOMP, JBCOMP) of the MET. grid. The upper right (UR) corner of the
computational grid is at grid point (IECOMP, JECOMP) of the MET. grid.
The grid spacing of the computational grid is the same as the MET. grid.

X index of LL corner (IBCOMP) No default ! IBCOMP = 168 !
(1 <= IBCOMP <= NX)

Y index of LL corner (JBCOMP) No default ! JBCOMP = 44 !
(1 <= JBCOMP <= NY)

X index of UR corner (IECOMP) No default ! IECOMP = 320 !
(1 <= IECOMP <= NX)

Y index of UR corner (JECOMP) No default ! JECOMP = 168 !
(1 <= JECOMP <= NY)

SAMPLING Grid (GRIDDED RECEPTORS):

The lower left (LL) corner of the sampling grid is at grid point
(IBSAMP, JBSAMP) of the MET. grid. The upper right (UR) corner of the
sampling grid is at grid point (IESAMP, JESAMP) of the MET. grid.
The sampling grid must be identical to or a subset of the computational
grid. It may be a nested grid inside the computational grid.
The grid spacing of the sampling grid is DGRIDKM/MESHDN.

Logical flag indicating if gridded
receptors are used (LSAMP) Default: T ! LSAMP = F !
(T=yes, F=no)

X index of LL corner (IBSAMP) No default ! IBSAMP = 1 !
(IBCOMP <= IBSAMP <= IECOMP)

```
     Y index of LL corner (JBSAMP)      No default     ! JBSAMP =  1   !
      (JBCOMP <= JBSAMP <= JECOMP)

     X index of UR corner (IESAMP)      No default     ! IESAMP =  251   !
      (IBCOMP <= IESAMP <= IECOMP)

     Y index of UR corner (JESAMP)      No default     ! JESAMP =  246   !
      (JBCOMP <= JESAMP <= JECOMP)

    Nesting factor of the sampling
     grid (MESHDN)                   Default: 1     ! MESHDN =  1  !
     (MESHDN is an integer >= 1)

!END!

-------------------------------------------------------------------------------

INPUT GROUP: 8 -- Size parameters for dry deposition of particles
--------------

   For SINGLE SPECIES, the mean and standard deviation are used to
   compute a deposition velocity for NINT (see group 9) size-ranges,
   and these are then averaged to obtain a mean deposition velocity.

   For GROUPED SPECIES, the size distribution should be explicitly
   specified (by the 'species' in the group), and the standard deviation
   for each should be entered as 0.  The model will then use the
   deposition velocity for the stated mean diameter.

   H2O2 data input option (MH2O2)    Default: 1            ! MH2O2 =  0   !
   (Used only if MAQCHEM = 1)
     0 = use a monthly background H2O2 value
     1 = read hourly H2O2 concentrations from
         the H2O2.DAT data file

   Monthly H2O2 concentrations
   (Used only if MQACHEM = 1 and
    MH2O2 = 0 or MH2O2 = 1 and all hourly H2O2 data missing)
   (BCKH2O2) in ppb                   Default: 12*1.
   !  BCKH2O2 = 1.00, 1.00, 1.00, 1.00, 1.00, 1.00, 1.00, 1.00, 1.00, 1.00, 1.00, 1.00 !

--- Data for SECONDARY ORGANIC AEROSOL (SOA) Option
   (used only if MCHEM = 4)

   The SOA module uses monthly values of:
       Fine particulate concentration in ug/m^3 (BCKPMF)
       Organic fraction of fine particulate     (OFRAC)
       VOC / NOX ratio (after reaction)         (VCNX)
   to characterize the air mass when computing
   the formation of SOA from VOC emissions.
   Typical values for several distinct air mass types are:

     Month    1    2    3    4    5    6    7    8    9   10   11   12

INPUT GROUP: 12 -- Misc. Dispersion and Computational Parameters
---------------

  Horizontal size of puff (m) beyond which
  time-dependent dispersion equations (Heffter)
  are used to determine sigma-y and
  sigma-z (SYTDEP)                           Default: 550.   ! SYTDEP = 5.5E02 !

  Switch for using Heffter equation for sigma z
  as above (0 = Not use Heffter; 1 = use Heffter
  (MHFTSZ)                                   Default: 0      ! MHFTSZ =  0   !

  Stability class used to determine plume
  growth rates for puffs above the boundary
  layer (JSUP)                               Default: 5      ! JSUP =  5   !

  Vertical dispersion constant for stable
  conditions (k1 in Eqn. 2.7-3)  (CONK1)     Default: 0.01   ! CONK1 = .01 !

  Vertical dispersion constant for neutral/
  unstable conditions (k2 in Eqn. 2.7-4)
  (CONK2)                                    Default: 0.1    ! CONK2 = .1 !

  Factor for determining Transition-point from
  Schulman-Scire to Huber-Snyder Building Downwash
  scheme (SS used for Hs < Hb + TBD * HL)
  (TBD)                                      Default: 0.5    ! TBD = .5 !
    TBD < 0   ==> always use Huber-Snyder
    TBD = 1.5 ==> always use Schulman-Scire
    TBD = 0.5 ==> ISC Transition-point

  Range of land use categories for which
  urban dispersion is assumed
  (IURB1, IURB2)                             Default: 10     ! IURB1 =  10  !
                                             19     ! IURB2 =  19  !

  Site characterization parameters for single-point Met data files ---------
  (needed for METFM = 2,3,4)

    Land use category for modeling domain
    (ILANDUIN)                               Default: 20     ! ILANDUIN =  20  !
```

Roughness length (m) for modeling domain
(Z0IN) Default: 0.25 ! Z0IN = .25 !

Leaf area index for modeling domain
(XLAIIN) Default: 3.0 ! XLAIIN = 3.0 !

Elevation above sea level (m)
(ELEVIN) Default: 0.0 ! ELEVIN = .0 !

Latitude (degrees) for met location
(XLATIN) Default: -999. ! XLATIN = -999.0 !

Longitude (degrees) for met location
(XLONIN) Default: -999. ! XLONIN = -999.0 !

Specialized information for interpreting single-point Met data files -----

Anemometer height (m) (Used only if METFM = 2,3)
(ANEMHT) Default: 10. ! ANEMHT = 10.0 !

Form of lateral turbulance data in PROFILE.DAT file
(Used only if METFM = 4 or MTURBVW = 1 or 3)
(ISIGMAV) Default: 1 ! ISIGMAV = 1 !
0 = read sigma-theta
1 = read sigma-v

Choice of mixing heights (Used only if METFM = 4)
(IMIXCTDM) Default: 0 ! IMIXCTDM = 0 !
0 = read PREDICTED mixing heights
1 = read OBSERVED mixing heights

Maximum length of a slug (met. grid units)
(XMXLEN) Default: 1.0 ! XMXLEN = 1.0 !

Maximum travel distance of a puff/slug (in
grid units) during one sampling step
(XSAMLEN) Default: 1.0 ! XSAMLEN = 1.0 !

Maximum Number of slugs/puffs release from
one source during one time step
(MXNEW) Default: 99 ! MXNEW = 99 !

Maximum Number of sampling steps for
one puff/slug during one time step
(MXSAM) Default: 99 ! MXSAM = 99 !

Number of iterations used when computing
the transport wind for a sampling step
that includes gradual rise (for CALMET
and PROFILE winds)
(NCOUNT) Default: 2 ! NCOUNT = 2 !

Minimum sigma y for a new puff/slug (m)
(SYMIN) Default: 1.0 ! SYMIN = 1.0 !

Minimum sigma z for a new puff/slug (m)

(SZMIN) Default: 1.0 ! SZMIN = 1.0 !

Default minimum turbulence velocities sigma-v and sigma-w
for each stability class over land and over water (m/s)
(SVMIN(12) and SWMIN(12))

```
              ----------  LAND  ----------       ---------  WATER  ----------
   Stab Class :  A    B    C    D    E    F         A    B    C    D    E    F
              ---  ---  ---  ---  ---  ---       ---  ---  ---  ---  ---  ---
Default SVMIN : .50, .50, .50, .50, .50, .50,      .37, .37, .37, .37, .37, .37
Default SWMIN : .20, .12, .08, .06, .03, .016,     .20, .12, .08, .06, .03, .016
```

! SVMIN = 0.500, 0.500, 0.500, 0.500, 0.500, 0.500, 0.370, 0.370, 0.370, 0.370, 0.370, 0.370!

Divergence criterion for dw/dz across puff
used to initiate adjustment for horizontal
convergence (1/s)
Partial adjustment starts at CDIV(1), and
full adjustment is reached at CDIV(2)
(CDIV(2)) Default: 0.0,0.0 ! CDIV = .0, .0 !

Minimum wind speed (m/s) allowed for
non-calm conditions. Also used as minimum
speed returned when using power-law
extrapolation toward surface
(WSCALM) Default: 0.5 ! WSCALM = .5 !

Maximum mixing height (m)
(XMAXZI) Default: 3000. ! XMAXZI = 4000.0 !

Minimum mixing height (m)
(XMINZI) Default: 50. ! XMINZI = 20.0 !

Default wind speed classes --
5 upper bounds (m/s) are entered;
the 6th class has no upper limit
(WSCAT(5)) Default :
ISC RURAL : 1.54, 3.09, 5.14, 8.23, 10.8 (10.8+)

```
Wind Speed Class :  1     2     3     4     5
                   ---   ---   ---   ---   ---
     ! WSCAT = 1.54, 3.09, 5.14, 8.23, 10.80 !
```

Default wind speed profile power-law
exponents for stabilities 1-6
(PLX0(6)) Default : ISC RURAL values
ISC RURAL : .07, .07, .10, .15, .35, .55
ISC URBAN : .15, .15, .20, .25, .30, .30

```
Stability Class :  A     B     C     D     E     F
                  ---   ---   ---   ---   ---   ---
     ! PLX0 = 0.07, 0.07, 0.10, 0.15, 0.35, 0.55 !
```

Default potential temperature gradient

for stable classes E, F (degK/m)
(PTG0(2))   Default: 0.020, 0.035
                                 ! PTG0 = 0.020,   0.035 !

Default plume path coefficients for
each stability class (used when option
for partial plume height terrain adjustment
is selected -- MCTADJ=3)
(PPC(6))   Stability Class : A   B   C   D   E   F
                             Default PPC : .50, .50, .50, .50, .35, .35
                                           ---   ---   ---   ---   ---   ---
                                 ! PPC = 0.50, 0.50, 0.50, 0.50, 0.35, 0.35 !

Slug-to-puff transition criterion factor
equal to sigma-y/length of slug
(SL2PF)   Default: 10.   ! SL2PF = 10.0 !

Puff-splitting control variables ------------------------

VERTICAL SPLIT

Number of puffs that result every time a puff
is split - nsplit=2 means that 1 puff splits
into 2
(NSPLIT)   Default: 3   ! NSPLIT = 3 !

Time(s) of a day when split puffs are eligible to
be split once again; this is typically set once
per day, around sunset before nocturnal shear develops.
24 values: 0 is midnight (00:00) and 23 is 11 PM (23:00)
0=do not re-split   1=eligible for re-split
(IRESPLIT(24))   Default: Hour 17 = 1
! IRESPLIT = 0,0,0,0,0,0,0,0,0,0,0,0,0,0,0,0,0,1,0,0,0,0,0,0 !

Split is allowed only if last hour's mixing
height (m) exceeds a minimum value
(ZISPLIT)   Default: 100.   ! ZISPLIT = 100.0 !

Split is allowed only if ratio of last hour's
mixing ht to the maximum mixing ht experienced
by the puff is less than a maximum value (this
postpones a split until a nocturnal layer develops)
(ROLDMAX)   Default: 0.25   ! ROLDMAX = 0.25 !

HORIZONTAL SPLIT

Number of puffs that result every time a puff
is split - nsplith=5 means that 1 puff splits
into 5
(NSPLITH)   Default: 5   ! NSPLITH = 5 !

Minimum sigma-y (Grid Cells Units) of puff
before it may be split

```
       (SYSPLITH)                    Default:  1.0      ! SYSPLITH = 1.0 !

       Minimum puff elongation rate (SYSPLITH/hr) due to
       wind shear, before it may be split
       (SHSPLITH)                    Default:  2.       ! SHSPLITH = 2.0 !

       Minimum concentration (g/m^3) of each
       species in puff before it may be split
       Enter array of NSPEC values; if a single value is
       entered, it will be used for ALL species
       (CNSPLITH)                    Default:  1.0E-07   ! CNSPLITH = 1.0E-07 !

     Integration control variables ------------------------

       Fractional convergence criterion for numerical SLUG
       sampling integration
       (EPSSLUG)                     Default:   1.0e-04  ! EPSSLUG = 1.0E-04 !

       Fractional convergence criterion for numerical AREA
       source integration
       (EPSAREA)                     Default:   1.0e-06  ! EPSAREA = 1.0E-06 !

       Trajectory step-length (m) used for numerical rise
       integration
       (DSRISE)                      Default:   1.0     ! DSRISE = 1.0 !

       Boundary Condition (BC) Puff control variables ------------------------

       Minimum height (m) to which BC puffs are mixed as they are emitted
       (MBCON=2 ONLY).  Actual height is reset to the current mixing height
       at the release point if greater than this minimum.
       (HTMINBC)                     Default:   500.     ! HTMINBC = 500.0 !

       Search radius (in BC segment lengths) about a receptor for sampling
       nearest BC puff.  BC puffs are emitted with a spacing of one segment
       length, so the search radius should be greater than 1.
       (RSAMPBC)                     Default:   4.      ! RSAMPBC = 10.0 !

       Near-Surface depletion adjustment to concentration profile used when
       sampling BC puffs?
       (MDEPBC)                      Default:   1       ! MDEPBC =  1  !
         0 = Concentration is NOT adjusted for depletion
         1 = Adjust Concentration for depletion

!END!

--------

   a
    Data for each source are treated as a separate input subgroup
    and therefore must end with an input group terminator.

    SRCNAM  is a 12-character name for a source
            (No default)
    X       is an array holding the source data listed by the column headings
            (No default)
    SIGYZI  is an array holding the initial sigma-y and sigma-z (m)
            (Default: 0.,0.)
    FMFAC   is a vertical momentum flux factor (0. or 1.0) used to represent
            the effect of rain-caps or other physical configurations that
            reduce momentum rise associated with the actual exit velocity.
            (Default: 1.0  -- full momentum used)

   b
    0. = No building downwash modeled, 1. = downwash modeled
    NOTE: must be entered as a REAL number (i.e., with decimal point)

   c
    An emission rate must be entered for every pollutant modeled.
    Enter emission rate of zero for secondary pollutants that are
    modeled, but not emitted.  Units are specified by IPTU
    (e.g. 1 for g/s).

---------------
Subgroup (13c)
---------------

           BUILDING DIMENSION DATA FOR SOURCES SUBJECT TO DOWNWASH
           -------------------------------------------------------
Source                                                       a
 No.       Effective building height, width, length and X/Y offset (in meters)
           every 10 degrees.  LENGTH, XBADJ, and YBADJ are only needed for
           MBDW=2 (PRIME downwash option)
```

------   ---

----

a
Building height, width, length, and X/Y offset from the source are treated as a separate input subgroup for each source and therefore must end with an input group terminator. The X/Y offset is the position, relative to the stack, of the center of the upwind face of the projected building, with the x-axis pointing along the flow direction.

----

a
Data for each receptor are treated as a separate input subgroup and therefore must end with an input group terminator.

b
Receptor height above ground is optional. If no value is entered, the receptor is placed on the ground.

INPUT GROUP: 1 -- General run control parameters
--------------

   Option to run all periods found
   in the met. file     (METRUN)   Default: 0       ! METRUN =   0  !

       METRUN = 0 - Run period explicitly defined below
       METRUN = 1 - Run all periods in met. file

    Starting date:   Year (IBYR) -- No default       ! IBYR =  2001 !
    (used only if   Month (IBMO) -- No default       ! IBMO =   1 !
     METRUN = 0)      Day (IBDY) -- No default       ! IBDY =   1  !
                    Hour (IBHR) -- No default       ! IBHR =   0 !
```

```
Base time zone        (XBTZ) -- No default       ! XBTZ = 0.0  !
  PST = 8., MST = 7.
  CST = 6., EST = 5.

Length of run (hours) (IRLG) -- No default       ! IRLG =  2160 !

Number of chemical species (NSPEC)
                     Default: 5       ! NSPEC =  6   !

Number of chemical species
to be emitted  (NSE)          Default: 3       ! NSE =  3   !

Flag to stop run after
SETUP phase (ITEST)           Default: 2       ! ITEST =  2   !
(Used to allow checking
of the model inputs, files, etc.)
    ITEST = 1 - STOPS program after SETUP phase
    ITEST = 2 - Continues with execution of program
            after SETUP

Restart Configuration:

  Control flag (MRESTART)      Default: 0       ! MRESTART =  0   !

    0 = Do not read or write a restart file
    1 = Read a restart file at the beginning of
       the run
    2 = Write a restart file during run
    3 = Read a restart file at beginning of run
       and write a restart file during run

  Number of periods in Restart
  output cycle (NRESPD)       Default: 0       ! NRESPD =  0   !

    0 = File written only at last period
   >0 = File updated every NRESPD periods

Meteorological Data Format (METFM)
                     Default: 1       ! METFM =  1   !

    METFM = 1 - CALMET binary file (CALMET.MET)
    METFM = 2 - ISC ASCII file (ISCMET.MET)
    METFM = 3 - AUSPLUME ASCII file (PLMMET.MET)
    METFM = 4 - CTDM plus tower file (PROFILE.DAT) and
            surface parameters file (SURFACE.DAT)

Meteorological Profile Data Format (MPRFFM)
      (used only for METFM = 1, 2, 3)
                     Default: 1       ! MPRFFM =  1   !

    MPRFFM = 1 - CTDM plus tower file (PROFILE.DAT)
    MPRFFM = 2 - AERMET tower file (PROFILE.DAT)

PG sigma-y is adjusted by the factor (AVET/PGTIME)**0.2
Averaging Time (minutes) (AVET)
                     Default: 60.0    ! AVET = 60. !
```

```
    PG Averaging Time (minutes) (PGTIME)
                          Default: 60.0    ! PGTIME = 60. !

!END!

-------------------------------------------------------------------------------

INPUT GROUP: 2 -- Technical options
--------------

    Vertical distribution used in the
    near field (MGAUSS)               Default: 1     ! MGAUSS =  1   !
      0 = uniform
      1 = Gaussian

    Terrain adjustment method
    (MCTADJ)                          Default: 3     ! MCTADJ =  3   !
      0 = no adjustment
      1 = ISC-type of terrain adjustment
      2 = simple, CALPUFF-type of terrain
         adjustment
      3 = partial plume path adjustment

    Subgrid-scale complex terrain
    flag (MCTSG)                      Default: 0     ! MCTSG =  0   !
      0 = not modeled
      1 = modeled

    Near-field puffs modeled as
    elongated 0 (MSLUG)               Default: 0     ! MSLUG =  0   !
      0 = no
      1 = yes (slug model used)

    Transitional plume rise modeled ?
    (MTRANS)                          Default: 1     ! MTRANS =  1   !
      0 = no  (i.e., final rise only)
      1 = yes (i.e., transitional rise computed)

    Stack tip downwash? (MTIP)        Default: 1     ! MTIP =  1  !
      0 = no  (i.e., no stack tip downwash)
      1 = yes (i.e., use stack tip downwash)

    Method used to simulate building
    downwash? (MBDW)                  Default: 1     ! MBDW =   1  !
      1 = ISC method
      2 = PRIME method

    Vertical wind shear modeled above
    stack top? (MSHEAR)               Default: 0     ! MSHEAR =  0  !
      0 = no  (i.e., vertical wind shear not modeled)
      1 = yes (i.e., vertical wind shear modeled)

    Puff splitting allowed? (MSPLIT)  Default: 0     ! MSPLIT =  0  !
```

0 = no (i.e., puffs not split)
1 = yes (i.e., puffs are split)

Chemical mechanism flag (MCHEM) Default: 1 ! MCHEM = 1 !
0 = chemical transformation not modeled
1 = transformation rates computed internally (MESOPUFF II scheme)
2 = user-specified transformation rates used
3 = transformation rates computed internally (RIVAD/ARM3 scheme)
4 = secondary organic aerosol formation computed (MESOPUFF II scheme for OH)

Aqueous phase transformation flag (MAQCHEM)
(Used only if MCHEM = 1, or 3) Default: 0 ! MAQCHEM = 0 !
0 = aqueous phase transformation not modeled
1 = transformation rates adjusted for aqueous phase reactions

Wet removal modeled ? (MWET) Default: 1 ! MWET = 1 !
0 = no
1 = yes

Dry deposition modeled ? (MDRY) Default: 1 ! MDRY = 1 !
0 = no
1 = yes
(dry deposition method specified for each species in Input Group 3)

Method used to compute dispersion
coefficients (MDISP) Default: 3 ! MDISP = 3 !

1 = dispersion coefficients computed from measured values of turbulence, sigma v, sigma w
2 = dispersion coefficients from internally calculated sigma v, sigma w using micrometeorological variables (u*, w*, L, etc.)
3 = PG dispersion coefficients for RURAL areas (computed using the ISCST multi-segment approximation) and MP coefficients in urban areas
4 = same as 3 except PG coefficients computed using the MESOPUFF II eqns.
5 = CTDM sigmas used for stable and neutral conditions. For unstable conditions, sigmas are computed as in MDISP = 3, described above. MDISP = 5 assumes that measured values are read

Sigma-v/sigma-theta, sigma-w measurements used? (MTURBVW)
(Used only if MDISP = 1 or 5) Default: 3 ! MTURBVW = 3 !
1 = use sigma-v or sigma-theta measurements from PROFILE.DAT to compute sigma-y (valid for METFM = 1, 2, 3, 4)
2 = use sigma-w measurements

from PROFILE.DAT to compute sigma-z
(valid for METFM = 1, 2, 3, 4)
3 = use both sigma-(v/theta) and sigma-w
from PROFILE.DAT to compute sigma-y and sigma-z
(valid for METFM = 1, 2, 3, 4)
4 = use sigma-theta measurements
from PLMMET.DAT to compute sigma-y
(valid only if METFM = 3)

Back-up method used to compute dispersion
when measured turbulence data are
missing (MDISP2) Default: 3 ! MDISP2 = 3 !
(used only if MDISP = 1 or 5)
2 = dispersion coefficients from internally calculated
sigma v, sigma w using micrometeorological variables
(u*, w*, L, etc.)
3 = PG dispersion coefficients for RURAL areas (computed using
the ISCST multi-segment approximation) and MP coefficients in
urban areas
4 = same as 3 except PG coefficients computed using
the MESOPUFF II eqns.

[DIAGNOSTIC FEATURE]
Method used for Lagrangian timescale for Sigma-y
(used only if MDISP=1,2 or MDISP2=1,2)
(MTAULY) Default: 0 ! MTAULY = 0 !
0 = Draxler default 617.284 (s)
1 = Computed as Lag. Length / (.75 q) -- after SCIPUFF
10 < Direct user input (s) -- e.g., 306.9

[DIAGNOSTIC FEATURE]
Method used for Advective-Decay timescale for Turbulence
(used only if MDISP=2 or MDISP2=2)
(MTAUADV) Default: 0 ! MTAUADV = 0 !
0 = No turbulence advection
1 = Computed (OPTION NOT IMPLEMENTED)
10 < Direct user input (s) -- e.g., 300

Boundary conditions (concentration) modeled?
Default: 0   ! MBCON = 0 !
(MBCON)
0 = no
1 = yes, using formatted BCON.DAT file
2 = yes, using unformatted CONC.DAT file

Analyses of fogging and icing impacts due to emissions from arrays of mechanically-forced cooling towers can be performed using CALPUFF in conjunction with a cooling tower emissions processor (CTEMISS) and its associated postprocessors. Hourly emissions of water vapor and temperature from each cooling tower cell are computed for the current cell configuration and ambient conditions by CTEMISS. CALPUFF models the dispersion of these emissions and provides cloud information in a specialized format for further analysis. Output to FOG.DAT is provided in either 'plume mode' or 'receptor mode' format.

Configure for FOG Model output?
Default: 0   ! MFOG = 0   !
(MFOG)
0 = no
1 = yes - report results in PLUME Mode format
2 = yes - report results in RECEPTOR Mode format

Test options specified to see if
they conform to regulatory

!END!

Subgroup (3b)

The following names are used for Species-Groups in which results for certain species are combined (added) prior to output. The CGRUP name will be used as the species name in output files. Use this feature to model specific particle-size distributions by treating each size-range as a separate species. Order must be consistent with 3(a) above.

INPUT GROUP: 4 -- Map Projection and Grid control parameters

```
    Projection for all (X,Y):
    -------------------------

    Map projection
    (PMAP)              Default: UTM    ! PMAP = LCC  !

       UTM :  Universal Transverse Mercator
       TTM :  Tangential Transverse Mercator
       LCC :  Lambert Conformal Conic
        PS :  Polar Stereographic
        EM :  Equatorial Mercator
      LAZA :  Lambert Azimuthal Equal Area

    False Easting and Northing (km) at the projection origin
    (Used only if PMAP= TTM, LCC, or LAZA)
    (FEAST)             Default=0.0     ! FEAST  = 0.000  !
    (FNORTH)            Default=0.0     ! FNORTH = 0.000  !

    UTM zone (1 to 60)
    (Used only if PMAP=UTM)
    (IUTMZN)            No Default      ! IUTMZN =  15   !

    Hemisphere for UTM projection?
    (Used only if PMAP=UTM)
    (UTMHEM)            Default: N      ! UTMHEM = N  !
       N   :  Northern hemisphere projection
       S   :  Southern hemisphere projection

    Latitude and Longitude (decimal degrees) of projection origin
    (Used only if PMAP= TTM, LCC, PS, EM, or LAZA)
    (RLAT0)             No Default      ! RLAT0 = 40N  !
    (RLON0)             No Default      ! RLON0 = 97W  !

       TTM :  RLON0 identifies central (true N/S) meridian of projection
              RLAT0 selected for convenience
       LCC :  RLON0 identifies central (true N/S) meridian of projection
              RLAT0 selected for convenience
       PS  :  RLON0 identifies central (grid N/S) meridian of projection
              RLAT0 selected for convenience
```

EM : RLON0 identifies central meridian of projection
RLAT0 is REPLACED by 0.0N (Equator)
LAZA: RLON0 identifies longitude of tangent-point of mapping plane
RLAT0 identifies latitude of tangent-point of mapping plane

Matching parallel(s) of latitude (decimal degrees) for projection
(Used only if PMAP= LCC or PS)
(XLAT1) No Default ! XLAT1 = 33N !
(XLAT2) No Default ! XLAT2 = 45N !

LCC : Projection cone slices through Earth's surface at XLAT1 and XLAT2
PS : Projection plane slices through Earth at XLAT1
(XLAT2 is not used)

Note: Latitudes and longitudes should be positive, and include a
letter N,S,E, or W indicating north or south latitude, and
east or west longitude. For example,
35.9 N Latitude = 35.9N
118.7 E Longitude = 118.7E

Datum-region

The Datum-Region for the coordinates is identified by a character string. Many mapping products currently available use the model of the Earth known as the World Geodetic System 1984 (WGS-G). Other local models may be in use, and their selection in CALMET will make its output consistent with local mapping products. The list of Datum-Regions with official transformation parameters is provided by the National Imagery and Mapping Agency (NIMA).

NIMA Datum - Regions(Examples)

WGS-G WGS-84 GRS 80 Spheroid, Global coverage (WGS84)
NAS-C NORTH AMERICAN 1927 Clarke 1866 Spheroid, MEAN FOR CONUS (NAD27)
NWS-27 NWS 6370KM Radius, Sphere
NWS-84 NWS 6370KM Radius, Sphere
ESR-S ESRI REFERENCE 6371KM Radius, Sphere

Datum-region for output coordinates
(DATUM) Default: WGS-G ! DATUM = WGS-G !

METEOROLOGICAL Grid:

Rectangular grid defined for projection PMAP,
with X the Easting and Y the Northing coordinate

No. X grid cells (NX) No default ! NX = 366 !
No. Y grid cells (NY) No default ! NY = 234 !
No. vertical layers (NZ) No default ! NZ = 10 !

Grid spacing (DGRIDKM) No default ! DGRIDKM = 6 !
Units: km

Cell face heights
(ZFACE(nz+1)) No defaults
Units: m
! ZFACE = 0., 20., 40., 80., 160., 320., 640., 1200., 2000., 3000.,
4000. !

Reference Coordinates
of SOUTHWEST corner of
grid cell(1, 1):

X-coordinate (XORIGKM) No default ! XORIGKM = -1008. !
Y coordinate (YORIGKM) No default ! YORIGKM = -864. !
Units: km

COMPUTATIONAL Grid:

The computational grid is identical to or a subset of the MET. grid.
The lower left (LL) corner of the computational grid is at grid point
(IBCOMP, JBCOMP) of the MET. grid. The upper right (UR) corner of the
computational grid is at grid point (IECOMP, JECOMP) of the MET. grid.
The grid spacing of the computational grid is the same as the MET. grid.

X index of LL corner (IBCOMP) No default ! IBCOMP = 168 !
(1 <= IBCOMP <= NX)

Y index of LL corner (JBCOMP) No default ! JBCOMP = 24 !
(1 <= JBCOMP <= NY)

X index of UR corner (IECOMP) No default ! IECOMP = 320 !
(1 <= IECOMP <= NX)

Y index of UR corner (JECOMP) No default ! JECOMP = 168 !
(1 <= JECOMP <= NY)

SAMPLING Grid (GRIDDED RECEPTORS):

The lower left (LL) corner of the sampling grid is at grid point
(IBSAMP, JBSAMP) of the MET. grid. The upper right (UR) corner of the
sampling grid is at grid point (IESAMP, JESAMP) of the MET. grid.
The sampling grid must be identical to or a subset of the computational
grid. It may be a nested grid inside the computational grid.
The grid spacing of the sampling grid is DGRIDKM/MESHDN.

Logical flag indicating if gridded
receptors are used (LSAMP) Default: T ! LSAMP = F !
(T=yes, F=no)

X index of LL corner (IBSAMP) No default ! IBSAMP = 1 !
(IBCOMP <= IBSAMP <= IECOMP)

Y index of LL corner (JBSAMP) No default ! JBSAMP = 1 !
(JBCOMP <= JBSAMP <= JECOMP)

```
    X index of UR corner (IESAMP)      No default     ! IESAMP =  251   !
     (IBCOMP <= IESAMP <= IECOMP)

    Y index of UR corner (JESAMP)      No default     ! JESAMP =  246   !
     (JBCOMP <= JESAMP <= JECOMP)

   Nesting factor of the sampling
    grid (MESHDN)                   Default: 1     ! MESHDN =  1  !
    (MESHDN is an integer >= 1)

!END!

INPUT GROUP: 8 -- Size parameters for dry deposition of particles
----

For SINGLE SPECIES, the mean and standard deviation are used to compute a deposition velocity for NINT (see group 9) size-ranges, and these are then averaged to obtain a mean deposition velocity.

For GROUPED SPECIES, the size distribution should be explicitly specified (by the 'species' in the group), and the standard deviation for each should be entered as 0. The model will then use the deposition velocity for the stated mean diameter.

      (Z0IN)                            Default: 0.25   ! Z0IN = .25 !

      Leaf area index for modeling domain
      (XLAIIN)                          Default: 3.0    ! XLAIIN = 3.0 !

      Elevation above sea level (m)
      (ELEVIN)                          Default: 0.0    ! ELEVIN = .0 !
```

Latitude (degrees) for met location
(XLATIN) Default: -999. ! XLATIN = -999.0 !

Longitude (degrees) for met location
(XLONIN) Default: -999. ! XLONIN = -999.0 !

Specialized information for interpreting single-point Met data files -----

Anemometer height (m) (Used only if METFM = 2,3)
(ANEMHT) Default: 10. ! ANEMHT = 10.0 !

Form of lateral turbulance data in PROFILE.DAT file
(Used only if METFM = 4 or MTURBVW = 1 or 3)
(ISIGMAV) Default: 1 ! ISIGMAV = 1 !
0 = read sigma-theta
1 = read sigma-v

Choice of mixing heights (Used only if METFM = 4)
(IMIXCTDM) Default: 0 ! IMIXCTDM = 0 !
0 = read PREDICTED mixing heights
1 = read OBSERVED mixing heights

Maximum length of a slug (met. grid units)
(XMXLEN) Default: 1.0 ! XMXLEN = 1.0 !

Maximum travel distance of a puff/slug (in
grid units) during one sampling step
(XSAMLEN) Default: 1.0 ! XSAMLEN = 1.0 !

Maximum Number of slugs/puffs release from
one source during one time step
(MXNEW) Default: 99 ! MXNEW = 99 !

Maximum Number of sampling steps for
one puff/slug during one time step
(MXSAM) Default: 99 ! MXSAM = 99 !

Number of iterations used when computing
the transport wind for a sampling step
that includes gradual rise (for CALMET
and PROFILE winds)
(NCOUNT) Default: 2 ! NCOUNT = 2 !

Minimum sigma y for a new puff/slug (m)
(SYMIN) Default: 1.0 ! SYMIN = 1.0 !

Minimum sigma z for a new puff/slug (m)
(SZMIN) Default: 1.0 ! SZMIN = 1.0 !

Default minimum turbulence velocities sigma-v and sigma-w
for each stability class over land and over water (m/s)
(SVMIN(12) and SWMIN(12))

```
           ----------  LAND  ----------       ---------  WATER  ----------
Stab Class :  A    B    C    D    E    F        A    B    C    D    E    F
             ---  ---  ---  ---  ---  ---      ---  ---  ---  ---  ---  ---
```

Default SVMIN : .50, .50, .50, .50, .50, .50,   .37, .37, .37, .37, .37, .37
Default SWMIN : .20, .12, .08, .06, .03, .016,   .20, .12, .08, .06, .03, .016

! SVMIN = 0.500, 0.500, 0.500, 0.500, 0.500, 0.500, 0.370, 0.370, 0.370, 0.370, 0.370, 0.370!
! SWMIN = 0.200, 0.120, 0.080, 0.060, 0.030, 0.016, 0.200, 0.120, 0.080, 0.060, 0.030, 0.016!

Divergence criterion for dw/dz across puff
used to initiate adjustment for horizontal
convergence (1/s)
Partial adjustment starts at CDIV(1), and
full adjustment is reached at CDIV(2)
(CDIV(2))   Default: 0.0,0.0 ! CDIV = .0, .0 !

Minimum wind speed (m/s) allowed for
non-calm conditions. Also used as minimum
speed returned when using power-law
extrapolation toward surface
(WSCALM)   Default: 0.5   ! WSCALM = .5 !

Maximum mixing height (m)
(XMAXZI)   Default: 3000. ! XMAXZI = 4000.0 !

Minimum mixing height (m)
(XMINZI)   Default: 50.   ! XMINZI = 20.0 !

Default wind speed classes --
5 upper bounds (m/s) are entered;
the 6th class has no upper limit
(WSCAT(5))   Default   :
ISC RURAL : 1.54, 3.09, 5.14, 8.23, 10.8 (10.8+)

Wind Speed Class : 1   2   3   4   5
--- --- --- --- ---
! WSCAT = 1.54, 3.09, 5.14, 8.23, 10.80 !

Default wind speed profile power-law
exponents for stabilities 1-6
(PLX0(6))   Default   : ISC RURAL values
ISC RURAL : .07, .07, .10, .15, .35, .55
ISC URBAN : .15, .15, .20, .25, .30, .30

Stability Class : A   B   C   D   E   F
--- --- --- --- --- ---
! PLX0 = 0.07, 0.07, 0.10, 0.15, 0.35, 0.55 !

Default potential temperature gradient
for stable classes E, F (degK/m)
(PTG0(2))   Default: 0.020, 0.035
! PTG0 = 0.020,   0.035 !

Default plume path coefficients for
each stability class (used when option
for partial plume height terrain adjustment
is selected -- MCTADJ=3)
(PPC(6))   Stability Class : A   B   C   D   E   F

Default PPC : .50, .50, .50, .50, .35, .35
--- --- --- --- --- ---
! PPC = 0.50, 0.50, 0.50, 0.50, 0.35, 0.35 !

Slug-to-puff transition criterion factor
equal to sigma-y/length of slug
(SL2PF) Default: 10. ! SL2PF = 10.0 !

Puff-splitting control variables ------------------------

VERTICAL SPLIT

Number of puffs that result every time a puff
is split - nsplit=2 means that 1 puff splits
into 2
(NSPLIT) Default: 3 ! NSPLIT = 3 !

Time(s) of a day when split puffs are eligible to
be split once again; this is typically set once
per day, around sunset before nocturnal shear develops.
24 values: 0 is midnight (00:00) and 23 is 11 PM (23:00)
0=do not re-split 1=eligible for re-split
(IRESPLIT(24)) Default: Hour 17 = 1
! IRESPLIT = 0,0,0,0,0,0,0,0,0,0,0,0,0,0,0,0,0,1,0,0,0,0,0,0 !

Split is allowed only if last hour's mixing
height (m) exceeds a minimum value
(ZISPLIT) Default: 100. ! ZISPLIT = 100.0 !

Split is allowed only if ratio of last hour's
mixing ht to the maximum mixing ht experienced
by the puff is less than a maximum value (this
postpones a split until a nocturnal layer develops)
(ROLDMAX) Default: 0.25 ! ROLDMAX = 0.25 !

HORIZONTAL SPLIT

Number of puffs that result every time a puff
is split - nsplith=5 means that 1 puff splits
into 5
(NSPLITH) Default: 5 ! NSPLITH = 5 !

Minimum sigma-y (Grid Cells Units) of puff
before it may be split
(SYSPLITH) Default: 1.0 ! SYSPLITH = 1.0 !

Minimum puff elongation rate (SYSPLITH/hr) due to
wind shear, before it may be split
(SHSPLITH) Default: 2. ! SHSPLITH = 2.0 !

Minimum concentration (g/m^3) of each
species in puff before it may be split
Enter array of NSPEC values; if a single value is

entered, it will be used for ALL species
(CNSPLITH)   Default: 1.0E-07   ! CNSPLITH = 1.0E-07 !

Integration control variables ------------------------

Fractional convergence criterion for numerical SLUG
sampling integration
(EPSSLUG)   Default: 1.0e-04 ! EPSSLUG = 1.0E-04 !

Fractional convergence criterion for numerical AREA
source integration
(EPSAREA)   Default: 1.0e-06 ! EPSAREA = 1.0E-06 !

Trajectory step-length (m) used for numerical rise
integration
(DSRISE)   Default: 1.0   ! DSRISE = 1.0 !

Boundary Condition (BC) Puff control variables ------------------------

Minimum height (m) to which BC puffs are mixed as they are emitted
(MBCON=2 ONLY). Actual height is reset to the current mixing height
at the release point if greater than this minimum.
(HTMINBC)   Default: 500.   ! HTMINBC = 500.0 !

Search radius (in BC segment lengths) about a receptor for sampling
nearest BC puff. BC puffs are emitted with a spacing of one segment
length, so the search radius should be greater than 1.
(RSAMPBC)   Default: 4.   ! RSAMPBC = 10.0 !

Near-Surface depletion adjustment to concentration profile used when
sampling BC puffs?
(MDEPBC)   Default: 1   ! MDEPBC = 1 !
  0 = Concentration is NOT adjusted for depletion
  1 = Adjust Concentration for depletion

!END!

INPUT GROUPS: 13a, 13b, 13c, 13d -- Point source parameters

Subgroup (13a)

--------

   a
    Data for each source are treated as a separate input subgroup
    and therefore must end with an input group terminator.

    SRCNAM  is a 12-character name for a source
          (No default)
    X       is an array holding the source data listed by the column headings
          (No default)
    SIGYZI  is an array holding the initial sigma-y and sigma-z (m)
          (Default: 0.,0.)
    FMFAC   is a vertical momentum flux factor (0. or 1.0) used to represent
          the effect of rain-caps or other physical configurations that
          reduce momentum rise associated with the actual exit velocity.
          (Default: 1.0  -- full momentum used)

   b
    0. = No building downwash modeled, 1. = downwash modeled
    NOTE: must be entered as a REAL number (i.e., with decimal point)
```

c
An emission rate must be entered for every pollutant modeled. Enter emission rate of zero for secondary pollutants that are modeled, but not emitted. Units are specified by IPTU (e.g. 1 for g/s).

Subgroup (13c)

BUILDING DIMENSION DATA FOR SOURCES SUBJECT TO DOWNWASH

```
Source                                                   a
 No.      Effective building height, width, length and X/Y offset (in meters)
        every 10 degrees.  LENGTH, XBADJ, and YBADJ are only needed for
        MBDW=2 (PRIME downwash option)
------   --------------------------------------------------------------------
```

----

a
Building height, width, length, and X/Y offset from the source are treated as a separate input subgroup for each source and therefore must end with an input group terminator. The X/Y offset is the position, relative to the stack, of the center of the upwind face of the projected building, with the x-axis pointing along the flow direction.

X Coordinate (km)	Y Coordinate (km)	Effect. Height (m)	Base Elevation (m)	Initial Sigma y (m)	Initial Sigma z (m)	Emission Rates [b]
----------	----------	------	------	--------	--------	--------

----

a
Data for each source are treated as a separate input subgroup
and therefore must end with an input group terminator.

b
An emission rate must be entered for every pollutant modeled.
Enter emission rate of zero for secondary pollutants that are
modeled, but not emitted. Units are specified by IVLU
(e.g. 1 for g/s).

Subgroup (16c)
----

a
VOLUME SOURCE: VARIABLE EMISSIONS DATA

Use this subgroup to describe temporal variations in the emission
rates given in 16b. Factors entered multiply the rates in 16b.
Skip sources here that have constant emissions. For more elaborate
variation in source parameters, use VOLEMARB.DAT and NVL2 > 0.

IVARY determines the type of variation, and is source-specific:
(IVARY) Default: 0
- 0 = Constant
- 1 = Diurnal cycle (24 scaling factors: hours 1-24)
- 2 = Monthly cycle (12 scaling factors: months 1-12)
- 3 = Hour & Season (4 groups of 24 hourly scaling factors, where first group is DEC-JAN-FEB)
- 4 = Speed & Stab. (6 groups of 6 scaling factors, where first group is Stability Class A, and the speed classes have upper bounds (m/s) defined in Group 12
- 5 = Temperature (12 scaling factors, where temperature classes have upper bounds (C) of: 0, 5, 10, 15, 20, 25, 30, 35, 40, 45, 50, 50+)

Number of non-gridded receptors (NREC) No default ! NREC = 2803 !

!END!

Subgroup (17b)

----

a
Data for each receptor are treated as a separate input subgroup and therefore must end with an input group terminator.

b
Receptor height above ground is optional. If no value is entered, the receptor is placed on the ground.

INPUT GROUP: 1 -- General run control parameters
--------------

   Option to run all periods found
   in the met. file     (METRUN)   Default: 0       ! METRUN =   0  !

       METRUN = 0 - Run period explicitly defined below
       METRUN = 1 - Run all periods in met. file
```

Starting date: Year (IBYR) -- No default ! IBYR = 2002 !
(used only if Month (IBMO) -- No default ! IBMO = 01 !
METRUN = 0) Day (IBDY) -- No default ! IBDY = 01 !
Hour (IBHR) -- No default ! IBHR = 0 !

Base time zone (XBTZ) -- No default ! XBTZ = 0.0 !
PST = 8., MST = 7.
CST = 6., EST = 5.

Length of run (hours) (IRLG) -- No default ! IRLG = 2160 !

Number of chemical species (NSPEC)
Default: 5 ! NSPEC = 7 !

Number of chemical species
to be emitted (NSE) Default: 3 ! NSE = 4 !

Flag to stop run after
SETUP phase (ITEST) Default: 2 ! ITEST = 2 !
(Used to allow checking
of the model inputs, files, etc.)
ITEST = 1 - STOPS program after SETUP phase
ITEST = 2 - Continues with execution of program
after SETUP

Restart Configuration:

Control flag (MRESTART) Default: 0 ! MRESTART = 0 !

0 = Do not read or write a restart file
1 = Read a restart file at the beginning of
the run
2 = Write a restart file during run
3 = Read a restart file at beginning of run
and write a restart file during run

Number of periods in Restart
output cycle (NRESPD) Default: 0 ! NRESPD = 0 !

0 = File written only at last period
>0 = File updated every NRESPD periods

Meteorological Data Format (METFM)
Default: 1 ! METFM = 1 !

METFM = 1 - CALMET binary file (CALMET.MET)
METFM = 2 - ISC ASCII file (ISCMET.MET)
METFM = 3 - AUSPLUME ASCII file (PLMMET.MET)
METFM = 4 - CTDM plus tower file (PROFILE.DAT) and
surface parameters file (SURFACE.DAT)

Meteorological Profile Data Format (MPRFFM)
(used only for METFM = 1, 2, 3)
Default: 1 ! MPRFFM = 1 !

MPRFFM = 1 - CTDM plus tower file (PROFILE.DAT)

MPRFFM = 2 - AERMET tower file (PROFILE.DAT)

PG sigma-y is adjusted by the factor (AVET/PGTIME)**0.2
Averaging Time (minutes) (AVET)
Default: 60.0 ! AVET = 60. !
PG Averaging Time (minutes) (PGTIME)
Default: 60.0 ! PGTIME = 60. !

!END!

INPUT GROUP: 2 -- Technical options

Vertical distribution used in the
near field (MGAUSS) Default: 1 ! MGAUSS = 1 !
0 = uniform
1 = Gaussian

Terrain adjustment method
(MCTADJ) Default: 3 ! MCTADJ = 3 !
0 = no adjustment
1 = ISC-type of terrain adjustment
2 = simple, CALPUFF-type of terrain
adjustment
3 = partial plume path adjustment

Subgrid-scale complex terrain
flag (MCTSG) Default: 0 ! MCTSG = 0 !
0 = not modeled
1 = modeled

Near-field puffs modeled as
elongated 0 (MSLUG) Default: 0 ! MSLUG = 0 !
0 = no
1 = yes (slug model used)

Transitional plume rise modeled ?
(MTRANS) Default: 1 ! MTRANS = 1 !
0 = no (i.e., final rise only)
1 = yes (i.e., transitional rise computed)

Stack tip downwash? (MTIP) Default: 1 ! MTIP = 1 !
0 = no (i.e., no stack tip downwash)
1 = yes (i.e., use stack tip downwash)

Method used to simulate building
downwash? (MBDW) Default: 1 ! MBDW = 1 !
1 = ISC method
2 = PRIME method

Vertical wind shear modeled above

stack top? (MSHEAR) Default: 0 ! MSHEAR = 0 !
0 = no (i.e., vertical wind shear not modeled)
1 = yes (i.e., vertical wind shear modeled)

Puff splitting allowed? (MSPLIT) Default: 0 ! MSPLIT = 0 !
0 = no (i.e., puffs not split)
1 = yes (i.e., puffs are split)

Chemical mechanism flag (MCHEM) Default: 1 ! MCHEM = 1 !
0 = chemical transformation not modeled
1 = transformation rates computed internally (MESOPUFF II scheme)
2 = user-specified transformation rates used
3 = transformation rates computed internally (RIVAD/ARM3 scheme)
4 = secondary organic aerosol formation computed (MESOPUFF II scheme for OH)

Aqueous phase transformation flag (MAQCHEM)
(Used only if MCHEM = 1, or 3) Default: 0 ! MAQCHEM = 0 !
0 = aqueous phase transformation not modeled
1 = transformation rates adjusted for aqueous phase reactions

Wet removal modeled ? (MWET) Default: 1 ! MWET = 1 !
0 = no
1 = yes

Dry deposition modeled ? (MDRY) Default: 1 ! MDRY = 1 !
0 = no
1 = yes
(dry deposition method specified for each species in Input Group 3)

Method used to compute dispersion
coefficients (MDISP) Default: 3 ! MDISP = 3 !

1 = dispersion coefficients computed from measured values of turbulence, sigma v, sigma w
2 = dispersion coefficients from internally calculated sigma v, sigma w using micrometeorological variables (u*, w*, L, etc.)
3 = PG dispersion coefficients for RURAL areas (computed using the ISCST multi-segment approximation) and MP coefficients in urban areas
4 = same as 3 except PG coefficients computed using the MESOPUFF II eqns.
5 = CTDM sigmas used for stable and neutral conditions. For unstable conditions, sigmas are computed as in MDISP = 3, described above. MDISP = 5 assumes that measured values are read

Sigma-v/sigma-theta, sigma-w measurements used? (MTURBVW)

```
 (Used only if MDISP = 1 or 5)         Default: 3     ! MTURBVW =  3  !
   1 = use sigma-v or sigma-theta measurements
       from PROFILE.DAT to compute sigma-y
       (valid for METFM = 1, 2, 3, 4)
   2 = use sigma-w measurements
       from PROFILE.DAT to compute sigma-z
       (valid for METFM = 1, 2, 3, 4)
   3 = use both sigma-(v/theta) and sigma-w
       from PROFILE.DAT to compute sigma-y and sigma-z
       (valid for METFM = 1, 2, 3, 4)
   4 = use sigma-theta measurements
       from PLMMET.DAT to compute sigma-y
       (valid only if METFM = 3)

 Back-up method used to compute dispersion
 when measured turbulence data are
 missing (MDISP2)                    Default: 3     ! MDISP2 =  3  !
 (used only if MDISP = 1 or 5)
   2 = dispersion coefficients from internally calculated
       sigma v, sigma w using micrometeorological variables
       (u*, w*, L, etc.)
   3 = PG dispersion coefficients for RURAL areas (computed using
       the ISCST multi-segment approximation) and MP coefficients in
       urban areas
   4 = same as 3 except PG coefficients computed using
       the MESOPUFF II eqns.

[DIAGNOSTIC FEATURE]
 Method used for Lagrangian timescale for Sigma-y
 (used only if MDISP=1,2 or MDISP2=1,2)
 (MTAULY)                            Default: 0     ! MTAULY =  0  !
   0 = Draxler default 617.284 (s)
   1 = Computed as Lag. Length / (.75 q) -- after SCIPUFF
  10 < Direct user input (s)             -- e.g., 306.9

 [DIAGNOSTIC FEATURE]
 Method used for Advective-Decay timescale for Turbulence
 (used only if MDISP=2 or MDISP2=2)
 (MTAUADV)                           Default: 0     ! MTAUADV =  0  !
   0 = No turbulence advection
   1 = Computed (OPTION NOT IMPLEMENTED)
  10 < Direct user input (s)   -- e.g., 300

 Method used to compute turbulence sigma-v &
 sigma-w using micrometeorological variables
 (Used only if MDISP = 2 or MDISP2 = 2)
 (MCTURB)                            Default: 1     ! MCTURB =  1  !
   1 = Standard CALPUFF subroutines
   2 = AERMOD subroutines

 PG sigma-y,z adj. for roughness?      Default: 0     ! MROUGH =  0  !
 (MROUGH)
   0 = no
   1 = yes
```

Partial plume penetration of   Default: 1   ! MPARTL = 1 !
elevated inversion?
(MPARTL)
  0 = no
  1 = yes

Strength of temperature inversion   Default: 0   ! MTINV = 0 !
provided in PROFILE.DAT extended records?
(MTINV)
  0 = no (computed from measured/default gradients)
  1 = yes

PDF used for dispersion under convective conditions?
                              Default: 0   ! MPDF = 0 !
(MPDF)
  0 = no
  1 = yes

Sub-Grid TIBL module used for shore line?
                              Default: 0   ! MSGTIBL = 0 !
(MSGTIBL)
  0 = no
  1 = yes

Boundary conditions (concentration) modeled?
                              Default: 0   ! MBCON = 0 !
(MBCON)
  0 = no
  1 = yes, using formatted BCON.DAT file
  2 = yes, using unformatted CONC.DAT file

Analyses of fogging and icing impacts due to emissions from arrays of mechanically-forced cooling towers can be performed using CALPUFF in conjunction with a cooling tower emissions processor (CTEMISS) and its associated postprocessors. Hourly emissions of water vapor and temperature from each cooling tower cell are computed for the current cell configuration and ambient conditions by CTEMISS. CALPUFF models the dispersion of these emissions and provides cloud information in a specialized format for further analysis. Output to FOG.DAT is provided in either 'plume mode' or 'receptor mode' format.

Configure for FOG Model output?
                              Default: 0   ! MFOG = 0   !
(MFOG)
  0 = no
  1 = yes - report results in PLUME Mode format
  2 = yes - report results in RECEPTOR Mode format

Test options specified to see if
they conform to regulatory
values? (MREG)   Default: 1   ! MREG = 1   !

  0 = NO checks are made

1 = Technical options must conform to USEPA
Long Range Transport (LRT) guidance

     Hemisphere for UTM projection?
     (Used only if PMAP=UTM)
     (UTMHEM)                 Default: N      ! UTMHEM = N  !
         N   :  Northern hemisphere projection
         S   :  Southern hemisphere projection

     Latitude and Longitude (decimal degrees) of projection origin
     (Used only if PMAP= TTM, LCC, PS, EM, or LAZA)
     (RLAT0)                  No Default      ! RLAT0 = 40N  !
     (RLON0)                  No Default      ! RLON0 = 97W  !
```

TTM : RLON0 identifies central (true N/S) meridian of projection
RLAT0 selected for convenience
LCC : RLON0 identifies central (true N/S) meridian of projection
RLAT0 selected for convenience
PS : RLON0 identifies central (grid N/S) meridian of projection
RLAT0 selected for convenience
EM : RLON0 identifies central meridian of projection
RLAT0 is REPLACED by 0.0N (Equator)
LAZA: RLON0 identifies longitude of tangent-point of mapping plane
RLAT0 identifies latitude of tangent-point of mapping plane

Matching parallel(s) of latitude (decimal degrees) for projection
(Used only if PMAP= LCC or PS)
(XLAT1) No Default ! XLAT1 = 33N !
(XLAT2) No Default ! XLAT2 = 45N !

LCC : Projection cone slices through Earth's surface at XLAT1 and XLAT2
PS : Projection plane slices through Earth at XLAT1
(XLAT2 is not used)

Note: Latitudes and longitudes should be positive, and include a
letter N,S,E, or W indicating north or south latitude, and
east or west longitude. For example,
35.9 N Latitude = 35.9N
118.7 E Longitude = 118.7E

Datum-region

The Datum-Region for the coordinates is identified by a character string. Many mapping products currently available use the model of the Earth known as the World Geodetic System 1984 (WGS-G). Other local models may be in use, and their selection in CALMET will make its output consistent with local mapping products. The list of Datum-Regions with official transformation parameters is provided by the National Imagery and Mapping Agency (NIMA).

NIMA Datum - Regions(Examples)

WGS-G WGS-84 GRS 80 Spheroid, Global coverage (WGS84)
NAS-C NORTH AMERICAN 1927 Clarke 1866 Spheroid, MEAN FOR CONUS (NAD27)
NWS-27 NWS 6370KM Radius, Sphere
NWS-84 NWS 6370KM Radius, Sphere
ESR-S ESRI REFERENCE 6371KM Radius, Sphere

Datum-region for output coordinates
(DATUM) Default: WGS-G ! DATUM = WGS-G !

METEOROLOGICAL Grid:

Rectangular grid defined for projection PMAP,
with X the Easting and Y the Northing coordinate

No. X grid cells (NX)   No default   ! NX = 366   !
No. Y grid cells (NY)   No default   ! NY = 234   !
No. vertical layers (NZ)   No default   ! NZ = 10   !

Grid spacing (DGRIDKM)   No default   ! DGRIDKM = 6 !
Units: km

Cell face heights
(ZFACE(nz+1))   No defaults
Units: m
! ZFACE = 0., 20., 40., 80., 160., 320., 640., 1200., 2000., 3000.,
4000. !

Reference Coordinates
of SOUTHWEST corner of
grid cell(1, 1):

X-coordinate (XORIGKM)   No default   ! XORIGKM = -1008. !
Y coordinate (YORIGKM)   No default   ! YORIGKM = -864. !
Units: km

COMPUTATIONAL Grid:

The computational grid is identical to or a subset of the MET. grid.
The lower left (LL) corner of the computational grid is at grid point
(IBCOMP, JBCOMP) of the MET. grid. The upper right (UR) corner of the
computational grid is at grid point (IECOMP, JECOMP) of the MET. grid.
The grid spacing of the computational grid is the same as the MET. grid.

X index of LL corner (IBCOMP)   No default   ! IBCOMP = 259 !
(1 <= IBCOMP <= NX)

Y index of LL corner (JBCOMP)   No default   ! JBCOMP = 65   !
(1 <= JBCOMP <= NY)

X index of UR corner (IECOMP)   No default   ! IECOMP = 347   !
(1 <= IECOMP <= NX)

Y index of UR corner (JECOMP)   No default   ! JECOMP = 122   !
(1 <= JECOMP <= NY)

SAMPLING Grid (GRIDDED RECEPTORS):

The lower left (LL) corner of the sampling grid is at grid point
(IBSAMP, JBSAMP) of the MET. grid. The upper right (UR) corner of the
sampling grid is at grid point (IESAMP, JESAMP) of the MET. grid.
The sampling grid must be identical to or a subset of the computational
grid. It may be a nested grid inside the computational grid.
The grid spacing of the sampling grid is DGRIDKM/MESHDN.

Logical flag indicating if gridded
receptors are used (LSAMP)   Default: T   ! LSAMP = F !

```
      (T=yes, F=no)

      X index of LL corner (IBSAMP)      No default     ! IBSAMP =  1   !
       (IBCOMP <= IBSAMP <= IECOMP)

      Y index of LL corner (JBSAMP)      No default     ! JBSAMP =  1   !
       (JBCOMP <= JBSAMP <= JECOMP)

      X index of UR corner (IESAMP)      No default     ! IESAMP =  251   !
       (IBCOMP <= IESAMP <= IECOMP)

      Y index of UR corner (JESAMP)      No default     ! JESAMP =  246   !
       (JBCOMP <= JESAMP <= JECOMP)

     Nesting factor of the sampling
      grid (MESHDN)                   Default: 1     ! MESHDN =  1  !
      (MESHDN is an integer >= 1)

!END!

INPUT GROUP: 8 -- Size parameters for dry deposition of particles
--------------

    For SINGLE SPECIES, the mean and standard deviation are used to
    compute a deposition velocity for NINT (see group 9) size-ranges,
    and these are then averaged to obtain a mean deposition velocity.

    For GROUPED SPECIES, the size distribution should be explicitly
    specified (by the 'species' in the group), and the standard deviation
    for each should be entered as 0.  The model will then use the
    deposition velocity for the stated mean diameter.

   The SOA module uses monthly values of:
      Fine particulate concentration in ug/m^3 (BCKPMF)
      Organic fraction of fine particulate     (OFRAC)
      VOC / NOX ratio (after reaction)         (VCNX)
   to characterize the air mass when computing
   the formation of SOA from VOC emissions.
   Typical values for several distinct air mass types are:

     Month    1    2    3    4    5    6    7    8    9   10   11   12

INPUT GROUP: 12 -- Misc. Dispersion and Computational Parameters
---------------

    Horizontal size of puff (m) beyond which
    time-dependent dispersion equations (Heffter)
    are used to determine sigma-y and
    sigma-z (SYTDEP)                          Default: 550.   ! SYTDEP = 5.5E02 !

    Switch for using Heffter equation for sigma z
    as above (0 = Not use Heffter; 1 = use Heffter
    (MHFTSZ)                                  Default: 0      ! MHFTSZ =  0   !

    Stability class used to determine plume
    growth rates for puffs above the boundary
    layer (JSUP)                              Default: 5      ! JSUP =  5   !

    Vertical dispersion constant for stable
    conditions (k1 in Eqn. 2.7-3)  (CONK1)     Default: 0.01   ! CONK1 = .01 !

    Vertical dispersion constant for neutral/
    unstable conditions (k2 in Eqn. 2.7-4)
    (CONK2)                                   Default: 0.1    ! CONK2 = .1 !

    Factor for determining Transition-point from
    Schulman-Scire to Huber-Snyder Building Downwash
    scheme (SS used for Hs < Hb + TBD * HL)
    (TBD)                                     Default: 0.5    ! TBD = .5 !
      TBD < 0   ==> always use Huber-Snyder
      TBD = 1.5 ==> always use Schulman-Scire
      TBD = 0.5 ==> ISC Transition-point

    Range of land use categories for which
    urban dispersion is assumed
    (IURB1, IURB2)                            Default: 10     ! IURB1 =  10  !
```

19 ! IURB2 = 19 !

Site characterization parameters for single-point Met data files ---------
(needed for METFM = 2,3,4)

Land use category for modeling domain
(ILANDUIN) Default: 20 ! ILANDUIN = 20 !

Roughness length (m) for modeling domain
(Z0IN) Default: 0.25 ! Z0IN = .25 !

Leaf area index for modeling domain
(XLAIIN) Default: 3.0 ! XLAIIN = 3.0 !

Elevation above sea level (m)
(ELEVIN) Default: 0.0 ! ELEVIN = .0 !

Latitude (degrees) for met location
(XLATIN) Default: -999. ! XLATIN = -999.0 !

Longitude (degrees) for met location
(XLONIN) Default: -999. ! XLONIN = -999.0 !

Specialized information for interpreting single-point Met data files -----

Anemometer height (m) (Used only if METFM = 2,3)
(ANEMHT) Default: 10. ! ANEMHT = 10.0 !

Form of lateral turbulance data in PROFILE.DAT file
(Used only if METFM = 4 or MTURBVW = 1 or 3)
(ISIGMAV) Default: 1 ! ISIGMAV = 1 !
0 = read sigma-theta
1 = read sigma-v

Choice of mixing heights (Used only if METFM = 4)
(IMIXCTDM) Default: 0 ! IMIXCTDM = 0 !
0 = read PREDICTED mixing heights
1 = read OBSERVED mixing heights

Maximum length of a slug (met. grid units)
(XMXLEN) Default: 1.0 ! XMXLEN = 1.0 !

Maximum travel distance of a puff/slug (in
grid units) during one sampling step
(XSAMLEN) Default: 1.0 ! XSAMLEN = 1.0 !

Maximum Number of slugs/puffs release from
one source during one time step
(MXNEW) Default: 99 ! MXNEW = 99 !

Maximum Number of sampling steps for
one puff/slug during one time step
(MXSAM) Default: 99 ! MXSAM = 99 !

Number of iterations used when computing
the transport wind for a sampling step

that includes gradual rise (for CALMET
and PROFILE winds)
(NCOUNT) Default: 2 ! NCOUNT = 2 !

Minimum sigma y for a new puff/slug (m)
(SYMIN) Default: 1.0 ! SYMIN = 1.0 !

Minimum sigma z for a new puff/slug (m)
(SZMIN) Default: 1.0 ! SZMIN = 1.0 !

Default minimum turbulence velocities sigma-v and sigma-w
for each stability class over land and over water (m/s)
(SVMIN(12) and SWMIN(12))

```
             ----------  LAND  ----------       ---------  WATER  ----------
  Stab Class :  A    B    C    D    E    F        A    B    C    D    E    F
             ---  ---  ---  ---  ---  ---       ---  ---  ---  ---  ---  ---
Default SVMIN : .50, .50, .50, .50, .50, .50,      .37, .37, .37, .37, .37, .37
Default SWMIN : .20, .12, .08, .06, .03, .016,     .20, .12, .08, .06, .03, .016
```

! SVMIN = 0.500, 0.500, 0.500, 0.500, 0.500, 0.500, 0.370, 0.370, 0.370, 0.370, 0.370, 0.370!
! SWMIN = 0.200, 0.120, 0.080, 0.060, 0.030, 0.016, 0.200, 0.120, 0.080, 0.060, 0.030, 0.016!

Divergence criterion for dw/dz across puff
used to initiate adjustment for horizontal
convergence (1/s)
Partial adjustment starts at CDIV(1), and
full adjustment is reached at CDIV(2)
(CDIV(2)) Default: 0.0,0.0 ! CDIV = .0, .0 !

Minimum wind speed (m/s) allowed for
non-calm conditions. Also used as minimum
speed returned when using power-law
extrapolation toward surface
(WSCALM) Default: 0.5 ! WSCALM = .5 !

Maximum mixing height (m)
(XMAXZI) Default: 3000. ! XMAXZI = 4000.0 !

Minimum mixing height (m)
(XMINZI) Default: 50. ! XMINZI = 20.0 !

Default wind speed classes --
5 upper bounds (m/s) are entered;
the 6th class has no upper limit
(WSCAT(5)) Default :
ISC RURAL : 1.54, 3.09, 5.14, 8.23, 10.8 (10.8+)

```
Wind Speed Class :  1     2     3     4     5
                   ---   ---   ---   ---   ---
     ! WSCAT = 1.54, 3.09, 5.14, 8.23, 10.80 !
```

Default wind speed profile power-law
exponents for stabilities 1-6
(PLX0(6)) Default : ISC RURAL values

ISC RURAL : .07, .07, .10, .15, .35, .55
ISC URBAN : .15, .15, .20, .25, .30, .30

Stability Class : A B C D E F
--- --- --- --- --- ---
! PLX0 = 0.07, 0.07, 0.10, 0.15, 0.35, 0.55 !

Default potential temperature gradient
for stable classes E, F (degK/m)
(PTG0(2)) Default: 0.020, 0.035
! PTG0 = 0.020, 0.035 !

Default plume path coefficients for
each stability class (used when option
for partial plume height terrain adjustment
is selected -- MCTADJ=3)
(PPC(6)) Stability Class : A B C D E F
Default PPC : .50, .50, .50, .50, .35, .35
--- --- --- --- --- ---
! PPC = 0.50, 0.50, 0.50, 0.50, 0.35, 0.35 !

Slug-to-puff transition criterion factor
equal to sigma-y/length of slug
(SL2PF) Default: 10. ! SL2PF = 10.0 !

Puff-splitting control variables ------------------------

VERTICAL SPLIT

Number of puffs that result every time a puff
is split - nsplit=2 means that 1 puff splits
into 2
(NSPLIT) Default: 3 ! NSPLIT = 3 !

Time(s) of a day when split puffs are eligible to
be split once again; this is typically set once
per day, around sunset before nocturnal shear develops.
24 values: 0 is midnight (00:00) and 23 is 11 PM (23:00)
0=do not re-split 1=eligible for re-split
(IRESPLIT(24)) Default: Hour 17 = 1
! IRESPLIT = 0,0,0,0,0,0,0,0,0,0,0,0,0,0,0,0,0,1,0,0,0,0,0,0 !

Split is allowed only if last hour's mixing
height (m) exceeds a minimum value
(ZISPLIT) Default: 100. ! ZISPLIT = 100.0 !

Split is allowed only if ratio of last hour's
mixing ht to the maximum mixing ht experienced
by the puff is less than a maximum value (this
postpones a split until a nocturnal layer develops)
(ROLDMAX) Default: 0.25 ! ROLDMAX = 0.25 !

HORIZONTAL SPLIT

```
Number of puffs that result every time a puff
is split - nsplith=5 means that 1 puff splits
into 5
(NSPLITH)                    Default:   5       ! NSPLITH =  5  !

Minimum sigma-y (Grid Cells Units) of puff
before it may be split
(SYSPLITH)                   Default:  1.0      ! SYSPLITH = 1.0 !

Minimum puff elongation rate (SYSPLITH/hr) due to
wind shear, before it may be split
(SHSPLITH)                   Default:  2.       ! SHSPLITH = 2.0 !

Minimum concentration (g/m^3) of each
species in puff before it may be split
Enter array of NSPEC values; if a single value is
entered, it will be used for ALL species
(CNSPLITH)                   Default:  1.0E-07   ! CNSPLITH = 1.0E-07 !

Integration control variables ------------------------

Fractional convergence criterion for numerical SLUG
sampling integration
(EPSSLUG)                    Default:   1.0e-04  ! EPSSLUG = 1.0E-04 !

Fractional convergence criterion for numerical AREA
source integration
(EPSAREA)                    Default:   1.0e-06  ! EPSAREA = 1.0E-06 !

Trajectory step-length (m) used for numerical rise
integration
(DSRISE)                     Default:   1.0      ! DSRISE = 1.0 !

Boundary Condition (BC) Puff control variables ------------------------

Minimum height (m) to which BC puffs are mixed as they are emitted
(MBCON=2 ONLY).  Actual height is reset to the current mixing height
at the release point if greater than this minimum.
(HTMINBC)                    Default:   500.     ! HTMINBC = 500.0 !

Search radius (in BC segment lengths) about a receptor for sampling
nearest BC puff.  BC puffs are emitted with a spacing of one segment
length, so the search radius should be greater than 1.
(RSAMPBC)                    Default:   4.       ! RSAMPBC = 10.0 !

Near-Surface depletion adjustment to concentration profile used when
sampling BC puffs?
(MDEPBC)                     Default:   1        ! MDEPBC =  1  !
  0 = Concentration is NOT adjusted for depletion
  1 = Adjust Concentration for depletion

!END!

--------
```

a
Data for each source are treated as a separate input subgroup
and therefore must end with an input group terminator.

SRCNAM is a 12-character name for a source
(No default)

X   is an array holding the source data listed by the column headings
(No default)
SIGYZI is an array holding the initial sigma-y and sigma-z (m)
(Default: 0.,0.)
FMFAC   is a vertical momentum flux factor (0. or 1.0) used to represent
the effect of rain-caps or other physical configurations that
reduce momentum rise associated with the actual exit velocity.
(Default: 1.0 -- full momentum used)

b
0. = No building downwash modeled, 1. = downwash modeled
NOTE: must be entered as a REAL number (i.e., with decimal point)

c
An emission rate must be entered for every pollutant modeled.
Enter emission rate of zero for secondary pollutants that are
modeled, but not emitted. Units are specified by IPTU
(e.g. 1 for g/s).

Subgroup (13c)

BUILDING DIMENSION DATA FOR SOURCES SUBJECT TO DOWNWASH

Source   a
No.   Effective building height, width, length and X/Y offset (in meters)
every 10 degrees. LENGTH, XBADJ, and YBADJ are only needed for
MBDW=2 (PRIME downwash option)
------   --

----

a
Building height, width, length, and X/Y offset from the source are treated
as a separate input subgroup for each source and therefore must end with
an input group terminator. The X/Y offset is the position, relative to the
stack, of the center of the upwind face of the projected building, with the
x-axis pointing along the flow direction.

Subgroup (13d)
----
a
POINT SOURCE: VARIABLE EMISSIONS DATA

Use this subgroup to describe temporal variations in the emission
rates given in 13b. Factors entered multiply the rates in 13b.
Skip sources here that have constant emissions. For more elaborate
variation in source parameters, use PTEMARB.DAT and NPT2 > 0.

IVARY determines the type of variation, and is source-specific:
(IVARY)   Default: 0
0 =   Constant
1 =   Diurnal cycle (24 scaling factors: hours 1-24)

2 = Monthly cycle (12 scaling factors: months 1-12)
3 = Hour & Season (4 groups of 24 hourly scaling factors,
where first group is DEC-JAN-FEB)
4 = Speed & Stab. (6 groups of 6 scaling factors, where
first group is Stability Class A,
and the speed classes have upper
bounds (m/s) defined in Group 12
5 = Temperature (12 scaling factors, where temperature
classes have upper bounds (C) of:
0, 5, 10, 15, 20, 25, 30, 35, 40,
45, 50, 50+)

----
a
Data for each species are treated as a separate input subgroup
and therefore must end with an input group terminator.

----

a
Data for each receptor are treated as a separate input subgroup and therefore must end with an input group terminator.

b
Receptor height above ground is optional. If no value is entered, the receptor is placed on the ground.

INPUT GROUP: 1 -- General run control parameters

Option to run all periods found
in the met. file(s) (METRUN)   Default: 0   ! METRUN =   1 !

METRUN = 0 - Run period explicitly defined below

```
       METRUN = 1 - Run all periods in CALPUFF data file(s)

     Starting date:    Year  (ISYR) --    No default   ! ISYR  =  2003   !
     (used only if     Month (ISMO) --    No default   ! ISMO  =  0   !
      METRUN = 0)      Day   (ISDY) --    No default   ! ISDY  =  0   !
                   Hour  (ISHR) --    No default   ! ISHR  =  0   !

     Number of hours to process (NHRS) -- No default   ! NHRS  =  0  !

     Process every hour of data?(NREP) -- Default: 1   ! NREP  =  1  !
      (1 = every hour processed,
       2 = every 2nd hour processed,
       5 = every 5th hour processed, etc.)

Species & Concentration/Deposition Information
----------------------------------------------

      Species to process (ASPEC)       -- No default   ! ASPEC = VISIB  !
      (ASPEC = VISIB for visibility processing)

      Layer/deposition code (ILAYER)   -- Default: 1   ! ILAYER =  1  !
        '1'  for CALPUFF concentrations,
        '-1' for dry deposition fluxes,
        '-2' for wet deposition fluxes,
        '-3' for wet+dry deposition fluxes.

      Scaling factors of the form:     -- Defaults:    ! A =  0.0    !
           X(new) = X(old) * A + B         A = 0.0    ! B =  0.0    !
        (NOT applied if A = B = 0.0)        B = 0.0

      Add Hourly Background Concentrations/Fluxes?
                          (LBACK)  -- Default: F   ! LBACK =  F !

Source information
------------------

  Option to process source contributions:
       0 =  Process only total reported contributions
       1 =  Sum all individual source contributions and process
       2 =  Run in TRACEBACK mode to identify source
            contributions at a SINGLE receptor
                         (MSOURCE) -- Default: 0   ! MSOURCE =  0  !

Receptor information
--------------------

  Gridded receptors processed?    (LG) -- Default: F   ! LG  = F  !
  Discrete receptors processed?   (LD) -- Default: F   ! LD  = T  !
  CTSG Complex terrain receptors processed?
                             (LCT) -- Default: F   ! LCT = F  !

--Report results by DISCRETE receptor RING?
  (only used when LD = T)     (LDRING) -- Default: F   ! LDRING = F  !

--Select range of DISCRETE receptors (only used when LD = T):
```

Select ALL DISCRETE receptors by setting NDRECP flag to -1;
OR
Select SPECIFIC DISCRETE receptors by entering a flag (0,1) for each
0 = discrete receptor not processed
1 = discrete receptor processed
using repeated value notation to select blocks of receptors:
23*1, 15*0, 12*1
Flag for all receptors after the last one assigned is set to 0
(NDRECP) -- Default: -1
! NDRECP = -1 !

--Select range of GRIDDED receptors (only used when LG = T):

X index of LL corner (IBGRID) -- Default: -1 ! IBGRID = -1 !
(-1 OR 1 <= IBGRID <= NX)

Y index of LL corner (JBGRID) -- Default: -1 ! JBGRID = -1 !
(-1 OR 1 <= JBGRID <= NY)

X index of UR corner (IEGRID) -- Default: -1 ! IEGRID = -1 !
(-1 OR 1 <= IEGRID <= NX)

Y index of UR corner (JEGRID) -- Default: -1 ! JEGRID = -1 !
(-1 OR 1 <= JEGRID <= NY)

Note: Entire grid is processed if IBGRID=JBGRID=IEGRID=JEGRID=-1

--Specific gridded receptors can also be excluded from CALPOST
processing by filling a processing grid array with 0s and 1s. If the
processing flag for receptor index (i,j) is 1 (ON), that receptor
will be processed if it lies within the range delineated by IBGRID,
JBGRID,IEGRID,JEGRID and if LG=T. If it is 0 (OFF), it will not be
processed in the run. By default, all array values are set to 1 (ON).

Number of gridded receptor rows provided in Subgroup (1a) to
identify specific gridded receptors to process
(NGONOFF) -- Default: 0 ! NGONOFF = 0 !

!END!

Subgroup (1a) -- Specific gridded receptors included/excluded

----

Specific gridded receptors are excluded from CALPOST processing
by filling a processing grid array with 0s and 1s. A total of
NGONOFF lines are read here. Each line corresponds to one 'row'
in the sampling grid, starting with the NORTHERNMOST row that
contains receptors that you wish to exclude, and finishing with
row 1 to the SOUTH (no intervening rows may be skipped). Within
a row, each receptor position is assigned either a 0 or 1,
starting with the westernmost receptor.
0 = gridded receptor not processed

```
      1 = gridded receptor processed

    Repeated value notation may be used to select blocks of receptors:
      23*1, 15*0, 12*1

    Because all values are initially set to 1, any receptors north of
    the first row entered, or east of the last value provided in a row,
    remain ON.

    (NGXRECP) -- Default: 1

-------------------------------------------------------------------------------

INPUT GROUP: 2 -- Visibility Parameters (ASPEC = VISIB)
--------------

    Identify the Base Time Zone for the CALPUFF simulation
                       (BTZONE) -- No default   * BTZONE =  0.*

    Particle growth curve f(RH) for hygroscopic species

          AMMONIUM SULFATE (EESO4) -- Default: 3.0 ! EESO4  = 3.0 !
          AMMONIUM NITRATE (EENO3) -- Default: 3.0 ! EENO3  = 3.0 !
          ORGANIC CARBON   (EEOC)  -- Default: 4.0 ! EEOC   = 4.0 !
```

SOIL (EESOIL)-- Default: 1.0 ! EESOIL = 1.0 !
ELEMENTAL CARBON (EEEC) -- Default: 10. ! EEEC = 10.0 !

Background Extinction Computation

Method used for the 24h-average of percent change of light extinction:
Hourly ratio of source light extinction / background light extinction
is averaged? (LAVER) -- Default: F ! LAVER = F !

Method used for background light extinction
(MVISBK) -- Default: 2 ! MVISBK = 2 !

1 = Supply single light extinction and hygroscopic fraction
- Hourly F(RH) adjustment applied to hygroscopic background and modeled sulfate and nitrate

2 = Compute extinction from speciated PM measurements (A)
- Hourly F(RH) adjustment applied to observed and modeled sulfate and nitrate
- F(RH) factor is capped at F(RHMAX)

3 = Compute extinction from speciated PM measurements (B)
- Hourly F(RH) adjustment applied to observed and modeled sulfate and nitrate
- Receptor-hour excluded if RH>RHMAX
- Receptor-day excluded if fewer than 6 valid receptor-hours

4 = Read hourly transmissometer background extinction measurements
- Hourly F(RH) adjustment applied to modeled sulfate and nitrate
- Hour excluded if measurement invalid (missing, interference, or large RH)
- Receptor-hour excluded if RH>RHMAX
- Receptor-day excluded if fewer than 6 valid receptor-hours

5 = Read hourly nephelometer background extinction measurements
- Rayleigh extinction value (BEXTRAY) added to measurement
- Hourly F(RH) adjustment applied to modeled sulfate and nitrate
- Hour excluded if measurement invalid (missing, interference, or large RH)
- Receptor-hour excluded if RH>RHMAX
- Receptor-day excluded if fewer than 6 valid receptor-hours

6 = Compute extinction from speciated PM measurements
- FLAG monthly RH adjustment factor applied to observed and modeled sulfate and nitrate

7 = Use observed weather or prognostic weather information for background extinction during weather events; otherwise, use Method 2
- Hourly F(RH) adjustment applied to modeled sulfate and nitrate
- F(RH) factor is capped at F(RHMAX)
- During observed weather events, compute Bext from visual range if using an observed weather data file, or
- During prognostic weather events, use Bext from the prognostic weather file
- Use Method 2 for hours without a weather event

Additional inputs used for MVISBK = 1:

Background light extinction (1/Mm)
(BEXTBK) -- No default ! BEXTBK = 12.0 !

Percentage of particles affected by relative humidity
(RHFRAC) -- No default ! RHFRAC = 10.0 !

Additional inputs used for MVISBK = 6:

Extinction coefficients for hygroscopic species (modeled and background) are computed using a monthly RH adjustment factor in place of an hourly RH factor (VISB.DAT file is NOT needed). Enter the 12 monthly factors here (RHFAC). Month 1 is January.

(RHFAC) -- No default ! RHFAC = 3.3, 3.0, 2.8, 2.6,
3.0, 3.2, 3.3, 3.5,
3.5, 3.1, 3.1, 3.3 !

Additional inputs used for MVISBK = 7:

The weather data file (DATSAV abbreviated space-delimited) that is identified as VSRN.DAT may contain data for more than one station. Identify the stations that are needed in the order in which they will be used to obtain valid weather and visual range. The first station that contains valid data for an hour will be used. Enter up to MXWSTA (set in PARAMS file) integer station IDs of up to 6 digits each as variable IDWSTA, and enter the corresponding time zone for each, as variable TZONE (= UTC-LST).

A prognostic weather data file with Bext for weather events may be used in place of the observed weather file. Identify this as the VSRN.DAT file and use a station ID of IDWSTA = 999999, and TZONE = 0.

NOTE: TZONE identifies the time zone used in the dataset. The DATSAV abbreviated space-delimited data usually are prepared with UTC time rather than local time, so TZONE is typically set to zero.

(IDWSTA) -- No default
! IDWSTA = 690230 ,80020 ,80140 !
(TZONE) -- No default
! TZONE = 0.0 ,0.0 ,0.0 !

Additional inputs used for MVISBK = 2,3,6,7:

Background extinction coefficients are computed from monthly CONCENTRATIONS of ammonium sulfate (BKSO4), ammonium nitrate (BKNO3), coarse particulates (BKPMC), organic carbon (BKOC), soil (BKSOIL), and elemental carbon (BKEC). Month 1 is January.
(ug/m**3)

(BKSO4) -- No default ! BKSO4 = 0.23, 0.23, 0.23, 0.23,

      5 =     Odour Units

   Visibility: extinction expressed in 1/Mega-meters (IPRTU is ignored)

Averaging time(s) reported
--------------------------

   1-hr averages          (L1HR) -- Default: T   !   L1HR = F  !

   3-hr averages          (L3HR) -- Default: T   !   L3HR = F  !

   24-hr averages         (L24HR) -- Default: T   !  L24HR = F  !

   Run-length averages    (LRUNL) -- Default: T   !  LRUNL = F  !

   User-specified averaging time in hours - results for
   an averaging time of NAVG hours are reported for
```

NAVG greater than 0:
(NAVG) -- Default: 0 ! NAVG = 0 !

Types of tabulations reported
----

1) Visibility: daily visibility tabulations are always reported
for the selected receptors when ASPEC = VISIB.
In addition, any of the other tabulations listed
below may be chosen to characterize the light
extinction coefficients.
[List file or Plot/Analysis File]

2) Top 50 table for each averaging time selected
[List file only]
(LT50) -- Default: T ! LT50 = F !

3) Top 'N' table for each averaging time selected
[List file or Plot file]
(LTOPN) -- Default: F ! LTOPN = F !

-- Number of 'Top-N' values at each receptor
selected (NTOP must be <= 4)
(NTOP) -- Default: 4 ! NTOP = 1 !

-- Specific ranks of 'Top-N' values reported
(NTOP values must be entered)
(ITOP(4) array) -- Default: ! ITOP = 1 !
1,2,3,4

4) Threshold exceedance counts for each receptor and each averaging
time selected
[List file or Plot file]
(LEXCD) -- Default: F ! LEXCD = F !

-- Identify the threshold for each averaging time by assigning a
non-negative value (output units).

-- Default: 0.5
Threshold for 1-hr averages (THRESH1) ! THRESH1 = 1.000E01 !
Threshold for 3-hr averages (THRESH3) ! THRESH3 = -1.0 !
Threshold for 24-hr averages (THRESH24) ! THRESH24 = -1.0 !
Threshold for NAVG-hr averages (THRESHN) ! THRESHN = -1.0 !

-- Counts for the shortest averaging period selected can be
tallied daily, and receptors that experience more than NCOUNT
counts over any NDAY period will be reported. This type of
exceedance violation output is triggered only if NDAY > 0.

Accumulation period(Days)
(NDAY) -- Default: 0 ! NDAY = 0 !
Number of exceedances allowed

(NCOUNT) -- Default: 1 ! NCOUNT = 1 !

5) Selected day table(s)

Echo Option -- Many records are written each averaging period
selected and output is grouped by day
[List file or Plot file]
(LECHO) -- Default: F ! LECHO = F !

Timeseries Option -- Averages at all selected receptors for
each selected averaging period are written to timeseries files.
Each file contains one averaging period, and all receptors are
written to a single record each averaging time.
[TSERIES_ASPEC_ttHR_CONC_TSUNAM.DAT files]
(LTIME) -- Default: F ! LTIME = F !

Peak Value Option -- Averages at all selected receptors for
each selected averaging period are screened and the peak value
each period is written to timeseries files.
Each file contains one averaging period.
[PEAKVAL_ASPEC_ttHR_CONC_TSUNAM.DAT files]
(LPEAK) -- Default: F ! LPEAK = F !

-- Days selected for output
(IECHO(366)) -- Default: 366*0
! IECHO = 366*0 !
(366 values must be entered)

Plot output options

Plot files can be created for the Top-N, Exceedance, and Echo
tables selected above. Two formats for these files are available,
DATA and GRID. In the DATA format, results at all receptors are
listed along with the receptor location [x,y,val1,val2,...].
In the GRID format, results at only gridded receptors are written,
using a compact representation. The gridded values are written in
rows (x varies), starting with the most southern row of the grid.
The GRID format is given the .GRD extension, and includes headers
compatible with the SURFER(R) plotting software.

A plotting and analysis file can also be created for the daily
peak visibility summary output, in DATA format only.

Generate Plot file output in addition to writing tables
to List file?
(LPLT) -- Default: F ! LPLT = F !

Use GRID format rather than DATA format,
when available?
(LGRD) -- Default: F ! LGRD = F !

Auxiliary Output Files (for subsequent analyses)

Visibility

A separate output file may be requested that contains the change
in visibility at each selected receptor when ASPEC = VISIB. This
file can be processed to construct visibility measures that are
not available in CALPOST.

Output file with the visibility change at each receptor?
(MDVIS) -- Default: 0 ! MDVIS = 0 !

0 = Do Not create file
1 = Create file of DAILY (24 hour) Delta-Deciview
2 = Create file of DAILY (24 hour) Extinction Change (%)
3 = Create file of HOURLY Delta-Deciview
4 = Create file of HOURLY Extinction Change (%)

Additional Debug Output

Output selected information to List file
for debugging?
(LDEBUG) -- Default: F ! LDEBUG = T !

Output hourly extinction information to REPORT.HRV?
(Visibility Method 7)
(LVEXTHR) -- Default: F ! LVEXTHR = F !

    Number of hours to process (NHRS) -- No default   ! NHRS  =  0  !

    Process every hour of data?(NREP) -- Default: 1   ! NREP  =  1  !
     (1 = every hour processed,
      2 = every 2nd hour processed,
      5 = every 5th hour processed, etc.)

Species & Concentration/Deposition Information
-------------------------------------------------

     Species to process (ASPEC)       -- No default   ! ASPEC = VISIB  !
     (ASPEC = VISIB for visibility processing)

     Layer/deposition code (ILAYER)   -- Default: 1   ! ILAYER =  1  !
       '1'  for CALPUFF concentrations,
       '-1' for dry deposition fluxes,
       '-2' for wet deposition fluxes,
       '-3' for wet+dry deposition fluxes.

     Scaling factors of the form:     -- Defaults:    ! A =  0.0    !
           X(new) = X(old) * A + B         A = 0.0    ! B =  0.0    !
       (NOT applied if A = B = 0.0)        B = 0.0

     Add Hourly Background Concentrations/Fluxes?
                         (LBACK)  -- Default: F   ! LBACK =  F !

Source information
-------------------

  Option to process source contributions:
       0 =  Process only total reported contributions
       1 =  Sum all individual source contributions and process
       2 =  Run in TRACEBACK mode to identify source
            contributions at a SINGLE receptor
                        (MSOURCE) -- Default: 0   ! MSOURCE =  0  !

Receptor information
--------------------

  Gridded receptors processed?    (LG) -- Default: F   ! LG  = F  !
  Discrete receptors processed?   (LD) -- Default: F   ! LD  = T  !
  CTSG Complex terrain receptors processed?
                           (LCT) -- Default: F   ! LCT = F  !

--Report results by DISCRETE receptor RING?
  (only used when LD = T)     (LDRING) -- Default: F   ! LDRING = F  !

--Select range of DISCRETE receptors (only used when LD = T):
```

Select ALL DISCRETE receptors by setting NDRECP flag to -1;
OR
Select SPECIFIC DISCRETE receptors by entering a flag (0,1) for each
0 = discrete receptor not processed
1 = discrete receptor processed
using repeated value notation to select blocks of receptors:
23*1, 15*0, 12*1
Flag for all receptors after the last one assigned is set to 0
(NDRECP) -- Default: -1
! NDRECP = -1 !

--Select range of GRIDDED receptors (only used when LG = T):

X index of LL corner (IBGRID) -- Default: -1 ! IBGRID = -1 !
(-1 OR 1 <= IBGRID <= NX)

Y index of LL corner (JBGRID) -- Default: -1 ! JBGRID = -1 !
(-1 OR 1 <= JBGRID <= NY)

X index of UR corner (IEGRID) -- Default: -1 ! IEGRID = -1 !
(-1 OR 1 <= IEGRID <= NX)

Y index of UR corner (JEGRID) -- Default: -1 ! JEGRID = -1 !
(-1 OR 1 <= JEGRID <= NY)

Note: Entire grid is processed if IBGRID=JBGRID=IEGRID=JEGRID=-1

--Specific gridded receptors can also be excluded from CALPOST processing by filling a processing grid array with 0s and 1s. If the processing flag for receptor index (i,j) is 1 (ON), that receptor will be processed if it lies within the range delineated by IBGRID, JBGRID,IEGRID,JEGRID and if LG=T. If it is 0 (OFF), it will not be processed in the run. By default, all array values are set to 1 (ON).

Number of gridded receptor rows provided in Subgroup (1a) to identify specific gridded receptors to process
(NGONOFF) -- Default: 0 ! NGONOFF = 0 !

!END!

Subgroup (1a) -- Specific gridded receptors included/excluded
----

Specific gridded receptors are excluded from CALPOST processing by filling a processing grid array with 0s and 1s. A total of NGONOFF lines are read here. Each line corresponds to one 'row' in the sampling grid, starting with the NORTHERNMOST row that contains receptors that you wish to exclude, and finishing with row 1 to the SOUTH (no intervening rows may be skipped). Within a row, each receptor position is assigned either a 0 or 1, starting with the westernmost receptor.
0 = gridded receptor not processed

1 = gridded receptor processed

Repeated value notation may be used to select blocks of receptors:
23*1, 15*0, 12*1

Because all values are initially set to 1, any receptors north of the first row entered, or east of the last value provided in a row, remain ON.

(NGXRECP) -- Default: 1

INPUT GROUP: 2 -- Visibility Parameters (ASPEC = VISIB)

```

          ORGANIC CARBON   (EEOC)  -- Default: 4.0 ! EEOC   = 4.0 !
```

SOIL (EESOIL)-- Default: 1.0 ! EESOIL = 1.0 !
ELEMENTAL CARBON (EEEC) -- Default: 10. ! EEEC = 10.0 !

Background Extinction Computation

Method used for the 24h-average of percent change of light extinction:
Hourly ratio of source light extinction / background light extinction
is averaged? (LAVER) -- Default: F ! LAVER = F !

Method used for background light extinction
(MVISBK) -- Default: 2 ! MVISBK = 6 !

1 = Supply single light extinction and hygroscopic fraction
- Hourly F(RH) adjustment applied to hygroscopic background
and modeled sulfate and nitrate
2 = Compute extinction from speciated PM measurements (A)
- Hourly F(RH) adjustment applied to observed and modeled sulfate
and nitrate
- F(RH) factor is capped at F(RHMAX)
3 = Compute extinction from speciated PM measurements (B)
- Hourly F(RH) adjustment applied to observed and modeled sulfate
and nitrate
- Receptor-hour excluded if RH>RHMAX
- Receptor-day excluded if fewer than 6 valid receptor-hours
4 = Read hourly transmissometer background extinction measurements
- Hourly F(RH) adjustment applied to modeled sulfate and nitrate
- Hour excluded if measurement invalid (missing, interference,
or large RH)
- Receptor-hour excluded if RH>RHMAX
- Receptor-day excluded if fewer than 6 valid receptor-hours
5 = Read hourly nephelometer background extinction measurements
- Rayleigh extinction value (BEXTRAY) added to measurement
- Hourly F(RH) adjustment applied to modeled sulfate and nitrate
- Hour excluded if measurement invalid (missing, interference,
or large RH)
- Receptor-hour excluded if RH>RHMAX
- Receptor-day excluded if fewer than 6 valid receptor-hours
6 = Compute extinction from speciated PM measurements
- FLAG monthly RH adjustment factor applied to observed and
modeled sulfate and nitrate
7 = Use observed weather or prognostic weather information for
background extinction during weather events; otherwise, use Method 2
- Hourly F(RH) adjustment applied to modeled sulfate and nitrate
- F(RH) factor is capped at F(RHMAX)
- During observed weather events, compute Bext from visual range
if using an observed weather data file, or
- During prognostic weather events, use Bext from the prognostic
weather file
- Use Method 2 for hours without a weather event

Additional inputs used for MVISBK = 1:

Background light extinction (1/Mm)
(BEXTBK) -- No default ! BEXTBK = 12.0 !

Percentage of particles affected by relative humidity
(RHFRAC) -- No default ! RHFRAC = 10.0 !

Additional inputs used for MVISBK = 6:

Extinction coefficients for hygroscopic species (modeled and background) are computed using a monthly RH adjustment factor in place of an hourly RH factor (VISB.DAT file is NOT needed). Enter the 12 monthly factors here (RHFAC). Month 1 is January.

```
(RHFAC)  -- No default     ! RHFAC = 3.3, 3.0, 2.8, 2.6,
                             3.0, 3.2, 3.3, 3.5,
                             3.5, 3.1, 3.1, 3.3 !
```

Additional inputs used for MVISBK = 7:

The weather data file (DATSAV abbreviated space-delimited) that is identified as VSRN.DAT may contain data for more than one station. Identify the stations that are needed in the order in which they will be used to obtain valid weather and visual range. The first station that contains valid data for an hour will be used. Enter up to MXWSTA (set in PARAMS file) integer station IDs of up to 6 digits each as variable IDWSTA, and enter the corresponding time zone for each, as variable TZONE (= UTC-LST).

A prognostic weather data file with Bext for weather events may be used in place of the observed weather file. Identify this as the VSRN.DAT file and use a station ID of IDWSTA = 999999, and TZONE = 0.

NOTE: TZONE identifies the time zone used in the dataset. The DATSAV abbreviated space-delimited data usually are prepared with UTC time rather than local time, so TZONE is typically set to zero.

```
 (IDWSTA)   -- No default
! IDWSTA = 690230 ,80020 ,80140 !
 (TZONE)    -- No default
! TZONE  = 0.0 ,0.0 ,0.0 !
```

Additional inputs used for MVISBK = 2,3,6,7:

Background extinction coefficients are computed from monthly CONCENTRATIONS of ammonium sulfate (BKSO4), ammonium nitrate (BKNO3), coarse particulates (BKPMC), organic carbon (BKOC), soil (BKSOIL), and elemental carbon (BKEC). Month 1 is January.
(ug/m**3)

```

Documentation
-------------

   Documentation records contained in the header of the
   CALPUFF output file may be written to the list file.
   Print documentation image?
                        (LDOC) -- Default: F   !  LDOC = F !

Output Units
------------
   Units for All Output       (IPRTU) -- Default: 1   ! IPRTU =  3   !
                for            for
           Concentration    Deposition
     1 =        g/m**3        g/m**2/s
     2 =       mg/m**3        mg/m**2/s
     3 =       ug/m**3        ug/m**2/s
     4 =       ng/m**3        ng/m**2/s
     5 =     Odour Units

   Visibility: extinction expressed in 1/Mega-meters (IPRTU is ignored)

Averaging time(s) reported
--------------------------

   1-hr averages          (L1HR) -- Default: T   !   L1HR = F  !

   3-hr averages          (L3HR) -- Default: T   !   L3HR = F  !

   24-hr averages         (L24HR) -- Default: T   !  L24HR = F  !

   Run-length averages    (LRUNL) -- Default: T   !  LRUNL = F  !

   User-specified averaging time in hours - results for
   an averaging time of NAVG hours are reported for
```

NAVG greater than 0:
(NAVG) -- Default: 0 ! NAVG = 0 !

Types of tabulations reported
----

1) Visibility: daily visibility tabulations are always reported
for the selected receptors when ASPEC = VISIB.
In addition, any of the other tabulations listed
below may be chosen to characterize the light
extinction coefficients.
[List file or Plot/Analysis File]

2) Top 50 table for each averaging time selected
[List file only]
(LT50) -- Default: T ! LT50 = F !

3) Top 'N' table for each averaging time selected
[List file or Plot file]
(LTOPN) -- Default: F ! LTOPN = T !

-- Number of 'Top-N' values at each receptor
selected (NTOP must be <= 4)
(NTOP) -- Default: 4 ! NTOP = 1 !

-- Specific ranks of 'Top-N' values reported
(NTOP values must be entered)
(ITOP(4) array) -- Default: ! ITOP = 1 !
1,2,3,4

4) Threshold exceedance counts for each receptor and each averaging
time selected
[List file or Plot file]
(LEXCD) -- Default: F ! LEXCD = T !

-- Identify the threshold for each averaging time by assigning a
non-negative value (output units).

-- Default: 0.5
Threshold for 1-hr averages (THRESH1) ! THRESH1 = 1.000E01 !
Threshold for 3-hr averages (THRESH3) ! THRESH3 = -1.0 !
Threshold for 24-hr averages (THRESH24) ! THRESH24 = -1.0 !
Threshold for NAVG-hr averages (THRESHN) ! THRESHN = -1.0 !

-- Counts for the shortest averaging period selected can be
tallied daily, and receptors that experience more than NCOUNT
counts over any NDAY period will be reported. This type of
exceedance violation output is triggered only if NDAY > 0.

Accumulation period(Days)
(NDAY) -- Default: 0 ! NDAY = 0 !
Number of exceedances allowed

(NCOUNT) -- Default: 1   ! NCOUNT = 1 !

5) Selected day table(s)

Echo Option -- Many records are written each averaging period
selected and output is grouped by day
[List file or Plot file]
(LECHO) -- Default: F   ! LECHO = F !

Timeseries Option -- Averages at all selected receptors for
each selected averaging period are written to timeseries files.
Each file contains one averaging period, and all receptors are
written to a single record each averaging time.
[TSERIES_ASPEC_ttHR_CONC_TSUNAM.DAT files]
(LTIME) -- Default: F   ! LTIME = F !

Peak Value Option -- Averages at all selected receptors for
each selected averaging period are screened and the peak value
each period is written to timeseries files.
Each file contains one averaging period.
[PEAKVAL_ASPEC_ttHR_CONC_TSUNAM.DAT files]
(LPEAK) -- Default: F   ! LPEAK = F !

-- Days selected for output
(IECHO(366)) -- Default: 366*0
! IECHO = 366*0 !
(366 values must be entered)

Plot output options

Plot files can be created for the Top-N, Exceedance, and Echo
tables selected above. Two formats for these files are available,
DATA and GRID. In the DATA format, results at all receptors are
listed along with the receptor location [x,y,val1,val2,...].
In the GRID format, results at only gridded receptors are written,
using a compact representation. The gridded values are written in
rows (x varies), starting with the most southern row of the grid.
The GRID format is given the .GRD extension, and includes headers
compatible with the SURFER(R) plotting software.

A plotting and analysis file can also be created for the daily
peak visibility summary output, in DATA format only.

Generate Plot file output in addition to writing tables
to List file?
(LPLT) -- Default: F   ! LPLT = F !

Use GRID format rather than DATA format,
when available?
(LGRD) -- Default: F   ! LGRD = F !

Auxiliary Output Files (for subsequent analyses)

Visibility

A separate output file may be requested that contains the change in visibility at each selected receptor when ASPEC = VISIB. This file can be processed to construct visibility measures that are not available in CALPOST.

Output file with the visibility change at each receptor?
(MDVIS) -- Default: 0 ! MDVIS = 0 !

0 = Do Not create file
1 = Create file of DAILY (24 hour) Delta-Deciview
2 = Create file of DAILY (24 hour) Extinction Change (%)
3 = Create file of HOURLY Delta-Deciview
4 = Create file of HOURLY Extinction Change (%)

Additional Debug Output

Output selected information to List file
for debugging?
(LDEBUG) -- Default: F ! LDEBUG = F !

Output hourly extinction information to REPORT.HRV?
(Visibility Method 7)
(LVEXTHR) -- Default: F ! LVEXTHR = F !

      (ASPEC = VISIB for visibility processing)

      Layer/deposition code (ILAYER)   -- Default: 1   ! ILAYER =  1  !
        '1'  for CALPUFF concentrations,
        '-1' for dry deposition fluxes,
        '-2' for wet deposition fluxes,
        '-3' for wet+dry deposition fluxes.

      Scaling factors of the form:     -- Defaults:    ! A =  0.0    !
           X(new) = X(old) * A + B         A = 0.0    ! B =  0.0    !
        (NOT applied if A = B = 0.0)        B = 0.0

      Add Hourly Background Concentrations/Fluxes?
                           (LBACK)  -- Default: F   ! LBACK =  F !

Source information
------------------

  Option to process source contributions:
       0 =  Process only total reported contributions
       1 =  Sum all individual source contributions and process
       2 =  Run in TRACEBACK mode to identify source
            contributions at a SINGLE receptor
                      (MSOURCE) -- Default: 0   ! MSOURCE =  0  !

Receptor information
--------------------

  Gridded receptors processed?    (LG) -- Default: F   ! LG  = F  !
  Discrete receptors processed?   (LD) -- Default: F   ! LD  = T  !
  CTSG Complex terrain receptors processed?
                          (LCT) -- Default: F   ! LCT = F  !

--Report results by DISCRETE receptor RING?
  (only used when LD = T)     (LDRING) -- Default: F   ! LDRING = F  !

--Select range of DISCRETE receptors (only used when LD = T):
```

```
  Select ALL DISCRETE receptors by setting NDRECP flag to -1;
                              OR
  Select SPECIFIC DISCRETE receptors by entering a flag (0,1) for each
     0 = discrete receptor not processed
     1 = discrete receptor processed
  using repeated value notation to select blocks of receptors:
     23*1, 15*0, 12*1
  Flag for all receptors after the last one assigned is set to 0
  (NDRECP) -- Default: -1
                                         ! NDRECP =  -1  !

--Select range of GRIDDED receptors (only used when LG = T):

       X index of LL corner (IBGRID) -- Default: -1     ! IBGRID = -1  !
           (-1 OR 1 <= IBGRID <= NX)

       Y index of LL corner (JBGRID) -- Default: -1     ! JBGRID = -1  !
           (-1 OR 1 <= JBGRID <= NY)

       X index of UR corner (IEGRID) -- Default: -1     ! IEGRID = -1  !
           (-1 OR 1 <= IEGRID <= NX)

       Y index of UR corner (JEGRID) -- Default: -1     ! JEGRID = -1  !
           (-1 OR 1 <= JEGRID <= NY)

  Note: Entire grid is processed if IBGRID=JBGRID=IEGRID=JEGRID=-1

--Specific gridded receptors can also be excluded from CALPOST
  processing by filling a processing grid array with 0s and 1s.  If the
  processing flag for receptor index (i,j) is 1 (ON), that receptor
  will be processed if it lies within the range delineated by IBGRID,
  JBGRID,IEGRID,JEGRID and if LG=T. If it is 0 (OFF), it will not be
  processed in the run.  By default, all array values are set to 1 (ON).

  Number of gridded receptor rows provided in Subgroup (1a) to
  identify specific gridded receptors to process
                         (NGONOFF) -- Default: 0      ! NGONOFF =  0  !

!END!

--------------
Subgroup (1a) -- Specific gridded receptors included/excluded
--------------

    Specific gridded receptors are excluded from CALPOST processing
    by filling a processing grid array with 0s and 1s.  A total of
    NGONOFF lines are read here.  Each line corresponds to one 'row'
    in the sampling grid, starting with the NORTHERNMOST row that
    contains receptors that you wish to exclude, and finishing with
    row 1 to the SOUTH (no intervening rows may be skipped).  Within
    a row, each receptor position is assigned either a 0 or 1,
    starting with the westernmost receptor.
       0 = gridded receptor not processed
```

```
     1 = gridded receptor processed

   Repeated value notation may be used to select blocks of receptors:
     23*1, 15*0, 12*1

   Because all values are initially set to 1, any receptors north of
   the first row entered, or east of the last value provided in a row,
   remain ON.

   (NGXRECP) -- Default: 1

          ORGANIC CARBON   (EEOC)  -- Default: 4.0 ! EEOC   = 4.0 !
```

SOIL (EESOIL)-- Default: 1.0 ! EESOIL = 1.0 !
ELEMENTAL CARBON (EEEC) -- Default: 10. ! EEEC = 10.0 !

Background Extinction Computation

Method used for the 24h-average of percent change of light extinction:
Hourly ratio of source light extinction / background light extinction
is averaged? (LAVER) -- Default: F ! LAVER = F !

Method used for background light extinction
(MVISBK) -- Default: 2 ! MVISBK = 2 !

1 = Supply single light extinction and hygroscopic fraction
- Hourly F(RH) adjustment applied to hygroscopic background
and modeled sulfate and nitrate
2 = Compute extinction from speciated PM measurements (A)
- Hourly F(RH) adjustment applied to observed and modeled sulfate
and nitrate
- F(RH) factor is capped at F(RHMAX)
3 = Compute extinction from speciated PM measurements (B)
- Hourly F(RH) adjustment applied to observed and modeled sulfate
and nitrate
- Receptor-hour excluded if RH>RHMAX
- Receptor-day excluded if fewer than 6 valid receptor-hours
4 = Read hourly transmissometer background extinction measurements
- Hourly F(RH) adjustment applied to modeled sulfate and nitrate
- Hour excluded if measurement invalid (missing, interference,
or large RH)
- Receptor-hour excluded if RH>RHMAX
- Receptor-day excluded if fewer than 6 valid receptor-hours
5 = Read hourly nephelometer background extinction measurements
- Rayleigh extinction value (BEXTRAY) added to measurement
- Hourly F(RH) adjustment applied to modeled sulfate and nitrate
- Hour excluded if measurement invalid (missing, interference,
or large RH)
- Receptor-hour excluded if RH>RHMAX
- Receptor-day excluded if fewer than 6 valid receptor-hours
6 = Compute extinction from speciated PM measurements
- FLAG monthly RH adjustment factor applied to observed and
modeled sulfate and nitrate
7 = Use observed weather or prognostic weather information for
background extinction during weather events; otherwise, use Method 2
- Hourly F(RH) adjustment applied to modeled sulfate and nitrate
- F(RH) factor is capped at F(RHMAX)
- During observed weather events, compute Bext from visual range
if using an observed weather data file, or
- During prognostic weather events, use Bext from the prognostic
weather file
- Use Method 2 for hours without a weather event

Additional inputs used for MVISBK = 1:

Background light extinction (1/Mm)
(BEXTBK) -- No default ! BEXTBK = 12.0 !

Percentage of particles affected by relative humidity
(RHFRAC) -- No default ! RHFRAC = 10.0 !

Additional inputs used for MVISBK = 6:

Extinction coefficients for hygroscopic species (modeled and background) are computed using a monthly RH adjustment factor in place of an hourly RH factor (VISB.DAT file is NOT needed). Enter the 12 monthly factors here (RHFAC). Month 1 is January.

```
(RHFAC)  -- No default     ! RHFAC = 3.2, 2.9, 2.7, 2.7,
                             3.3, 3.3, 3.3, 3.3,
                             3.4, 3.1, 3.1, 3.3 !
```

Additional inputs used for MVISBK = 7:

The weather data file (DATSAV abbreviated space-delimited) that is identified as VSRN.DAT may contain data for more than one station. Identify the stations that are needed in the order in which they will be used to obtain valid weather and visual range. The first station that contains valid data for an hour will be used. Enter up to MXWSTA (set in PARAMS file) integer station IDs of up to 6 digits each as variable IDWSTA, and enter the corresponding time zone for each, as variable TZONE (= UTC-LST).

A prognostic weather data file with Bext for weather events may be used in place of the observed weather file. Identify this as the VSRN.DAT file and use a station ID of IDWSTA = 999999, and TZONE = 0.

NOTE: TZONE identifies the time zone used in the dataset. The DATSAV abbreviated space-delimited data usually are prepared with UTC time rather than local time, so TZONE is typically set to zero.

```
 (IDWSTA)   -- No default
! IDWSTA = 690230 ,80020 ,80140 !
 (TZONE)    -- No default
! TZONE  = 0.0 ,0.0 ,0.0 !
```

Additional inputs used for MVISBK = 2,3,6,7:

Background extinction coefficients are computed from monthly CONCENTRATIONS of ammonium sulfate (BKSO4), ammonium nitrate (BKNO3), coarse particulates (BKPMC), organic carbon (BKOC), soil (BKSOIL), and elemental carbon (BKEC). Month 1 is January.
(ug/m**3)

```

Documentation
-------------

   Documentation records contained in the header of the
   CALPUFF output file may be written to the list file.
   Print documentation image?
                        (LDOC) -- Default: F   !  LDOC = F !

Output Units
------------
   Units for All Output       (IPRTU) -- Default: 1   ! IPRTU =  3   !
                for           for
            Concentration    Deposition
     1 =        g/m**3         g/m**2/s
     2 =       mg/m**3        mg/m**2/s
     3 =       ug/m**3        ug/m**2/s
     4 =       ng/m**3        ng/m**2/s
     5 =     Odour Units

   Visibility: extinction expressed in 1/Mega-meters (IPRTU is ignored)

Averaging time(s) reported
--------------------------

   1-hr averages          (L1HR) -- Default: T   !   L1HR = F  !

   3-hr averages          (L3HR) -- Default: T   !   L3HR = F  !

   24-hr averages         (L24HR) -- Default: T   !  L24HR = F  !

   Run-length averages    (LRUNL) -- Default: T   !  LRUNL = F  !

   User-specified averaging time in hours - results for
   an averaging time of NAVG hours are reported for
```

NAVG greater than 0:
(NAVG) -- Default: 0 ! NAVG = 0 !

Types of tabulations reported
----

1) Visibility: daily visibility tabulations are always reported
for the selected receptors when ASPEC = VISIB.
In addition, any of the other tabulations listed
below may be chosen to characterize the light
extinction coefficients.
[List file or Plot/Analysis File]

2) Top 50 table for each averaging time selected
[List file only]
(LT50) -- Default: T ! LT50 = F !

3) Top 'N' table for each averaging time selected
[List file or Plot file]
(LTOPN) -- Default: F ! LTOPN = T !

-- Number of 'Top-N' values at each receptor
selected (NTOP must be <= 4)
(NTOP) -- Default: 4 ! NTOP = 1 !

-- Specific ranks of 'Top-N' values reported
(NTOP values must be entered)
(ITOP(4) array) -- Default: ! ITOP = 1 !
1,2,3,4

4) Threshold exceedance counts for each receptor and each averaging
time selected
[List file or Plot file]
(LEXCD) -- Default: F ! LEXCD = T !

-- Identify the threshold for each averaging time by assigning a
non-negative value (output units).

-- Default: 0.5
Threshold for 1-hr averages (THRESH1) ! THRESH1 = 1.000E01 !
Threshold for 3-hr averages (THRESH3) ! THRESH3 = -1.0 !
Threshold for 24-hr averages (THRESH24) ! THRESH24 = -1.0 !
Threshold for NAVG-hr averages (THRESHN) ! THRESHN = -1.0 !

-- Counts for the shortest averaging period selected can be
tallied daily, and receptors that experience more than NCOUNT
counts over any NDAY period will be reported. This type of
exceedance violation output is triggered only if NDAY > 0.

Accumulation period(Days)
(NDAY) -- Default: 0 ! NDAY = 0 !
Number of exceedances allowed

(NCOUNT) -- Default: 1 ! NCOUNT = 1 !

5) Selected day table(s)

Echo Option -- Many records are written each averaging period
selected and output is grouped by day
[List file or Plot file]
(LECHO) -- Default: F ! LECHO = F !

Timeseries Option -- Averages at all selected receptors for
each selected averaging period are written to timeseries files.
Each file contains one averaging period, and all receptors are
written to a single record each averaging time.
[TSERIES_ASPEC_ttHR_CONC_TSUNAM.DAT files]
(LTIME) -- Default: F ! LTIME = F !

Peak Value Option -- Averages at all selected receptors for
each selected averaging period are screened and the peak value
each period is written to timeseries files.
Each file contains one averaging period.
[PEAKVAL_ASPEC_ttHR_CONC_TSUNAM.DAT files]
(LPEAK) -- Default: F ! LPEAK = F !

-- Days selected for output
(IECHO(366)) -- Default: 366*0
! IECHO = 366*0 !
(366 values must be entered)

Plot output options

Plot files can be created for the Top-N, Exceedance, and Echo
tables selected above. Two formats for these files are available,
DATA and GRID. In the DATA format, results at all receptors are
listed along with the receptor location [x,y,val1,val2,...].
In the GRID format, results at only gridded receptors are written,
using a compact representation. The gridded values are written in
rows (x varies), starting with the most southern row of the grid.
The GRID format is given the .GRD extension, and includes headers
compatible with the SURFER(R) plotting software.

A plotting and analysis file can also be created for the daily
peak visibility summary output, in DATA format only.

Generate Plot file output in addition to writing tables
to List file?
(LPLT) -- Default: F ! LPLT = F !

Use GRID format rather than DATA format,
when available?
(LGRD) -- Default: F ! LGRD = F !

Auxiliary Output Files (for subsequent analyses)

Visibility

A separate output file may be requested that contains the change in visibility at each selected receptor when ASPEC = VISIB. This file can be processed to construct visibility measures that are not available in CALPOST.

Output file with the visibility change at each receptor?
(MDVIS) -- Default: 0   ! MDVIS = 0 !

0 = Do Not create file
1 = Create file of DAILY (24 hour) Delta-Deciview
2 = Create file of DAILY (24 hour) Extinction Change (%)
3 = Create file of HOURLY Delta-Deciview
4 = Create file of HOURLY Extinction Change (%)

Additional Debug Output

Output selected information to List file
for debugging?
(LDEBUG) -- Default: F ! LDEBUG = F !

Output hourly extinction information to REPORT.HRV?
(Visibility Method 7)
(LVEXTHR) -- Default: F ! LVEXTHR = F !

     Number of hours to process (NHRS) -- No default   ! NHRS  =  0  !

     Process every hour of data?(NREP) -- Default: 1   ! NREP  =  1  !
      (1 = every hour processed,
       2 = every 2nd hour processed,
       5 = every 5th hour processed, etc.)

Species & Concentration/Deposition Information
---------------------------------------------

      Species to process (ASPEC)       -- No default   ! ASPEC = VISIB  !
      (ASPEC = VISIB for visibility processing)

      Layer/deposition code (ILAYER)   -- Default: 1   ! ILAYER =  1  !
        '1'  for CALPUFF concentrations,
        '-1' for dry deposition fluxes,
        '-2' for wet deposition fluxes,
        '-3' for wet+dry deposition fluxes.

      Scaling factors of the form:     -- Defaults:    ! A =  0.0    !
           X(new) = X(old) * A + B         A = 0.0    ! B =  0.0    !
        (NOT applied if A = B = 0.0)        B = 0.0

      Add Hourly Background Concentrations/Fluxes?
                         (LBACK)  -- Default: F   ! LBACK =  F !

Source information
------------------

  Option to process source contributions:
       0 =  Process only total reported contributions
       1 =  Sum all individual source contributions and process
       2 =  Run in TRACEBACK mode to identify source
            contributions at a SINGLE receptor
                        (MSOURCE) -- Default: 0   ! MSOURCE =  0  !

Receptor information
--------------------

  Gridded receptors processed?    (LG) -- Default: F   ! LG  = F  !
  Discrete receptors processed?   (LD) -- Default: F   ! LD  = T  !
  CTSG Complex terrain receptors processed?
                            (LCT) -- Default: F   ! LCT = F  !

--Report results by DISCRETE receptor RING?
  (only used when LD = T)     (LDRING) -- Default: F   ! LDRING = F  !

--Select range of DISCRETE receptors (only used when LD = T):
```

Select ALL DISCRETE receptors by setting NDRECP flag to -1;
OR
Select SPECIFIC DISCRETE receptors by entering a flag (0,1) for each
0 = discrete receptor not processed
1 = discrete receptor processed
using repeated value notation to select blocks of receptors:
23*1, 15*0, 12*1
Flag for all receptors after the last one assigned is set to 0
(NDRECP) -- Default: -1
! NDRECP = -1 !

--Select range of GRIDDED receptors (only used when LG = T):

X index of LL corner (IBGRID) -- Default: -1 ! IBGRID = -1 !
(-1 OR 1 <= IBGRID <= NX)

Y index of LL corner (JBGRID) -- Default: -1 ! JBGRID = -1 !
(-1 OR 1 <= JBGRID <= NY)

X index of UR corner (IEGRID) -- Default: -1 ! IEGRID = -1 !
(-1 OR 1 <= IEGRID <= NX)

Y index of UR corner (JEGRID) -- Default: -1 ! JEGRID = -1 !
(-1 OR 1 <= JEGRID <= NY)

Note: Entire grid is processed if IBGRID=JBGRID=IEGRID=JEGRID=-1

--Specific gridded receptors can also be excluded from CALPOST processing by filling a processing grid array with 0s and 1s. If the processing flag for receptor index (i,j) is 1 (ON), that receptor will be processed if it lies within the range delineated by IBGRID, JBGRID,IEGRID,JEGRID and if LG=T. If it is 0 (OFF), it will not be processed in the run. By default, all array values are set to 1 (ON).

Number of gridded receptor rows provided in Subgroup (1a) to identify specific gridded receptors to process
(NGONOFF) -- Default: 0 ! NGONOFF = 0 !

!END!

Subgroup (1a) -- Specific gridded receptors included/excluded
----

Specific gridded receptors are excluded from CALPOST processing by filling a processing grid array with 0s and 1s. A total of NGONOFF lines are read here. Each line corresponds to one 'row' in the sampling grid, starting with the NORTHERNMOST row that contains receptors that you wish to exclude, and finishing with row 1 to the SOUTH (no intervening rows may be skipped). Within a row, each receptor position is assigned either a 0 or 1, starting with the westernmost receptor.
0 = gridded receptor not processed

```
      1 = gridded receptor processed

   Repeated value notation may be used to select blocks of receptors:
      23*1, 15*0, 12*1

   Because all values are initially set to 1, any receptors north of
   the first row entered, or east of the last value provided in a row,
   remain ON.

   (NGXRECP) -- Default: 1

Background Extinction Computation

Method used for the 24h-average of percent change of light extinction:
Hourly ratio of source light extinction / background light extinction
is averaged? (LAVER) -- Default: F ! LAVER = F !

Method used for background light extinction
(MVISBK) -- Default: 2 ! MVISBK = 6 !

1 = Supply single light extinction and hygroscopic fraction
- Hourly F(RH) adjustment applied to hygroscopic background
and modeled sulfate and nitrate
2 = Compute extinction from speciated PM measurements (A)
- Hourly F(RH) adjustment applied to observed and modeled sulfate
and nitrate
- F(RH) factor is capped at F(RHMAX)
3 = Compute extinction from speciated PM measurements (B)
- Hourly F(RH) adjustment applied to observed and modeled sulfate
and nitrate
- Receptor-hour excluded if RH>RHMAX
- Receptor-day excluded if fewer than 6 valid receptor-hours
4 = Read hourly transmissometer background extinction measurements
- Hourly F(RH) adjustment applied to modeled sulfate and nitrate
- Hour excluded if measurement invalid (missing, interference,
or large RH)
- Receptor-hour excluded if RH>RHMAX
- Receptor-day excluded if fewer than 6 valid receptor-hours
5 = Read hourly nephelometer background extinction measurements
- Rayleigh extinction value (BEXTRAY) added to measurement
- Hourly F(RH) adjustment applied to modeled sulfate and nitrate
- Hour excluded if measurement invalid (missing, interference,
or large RH)
- Receptor-hour excluded if RH>RHMAX
- Receptor-day excluded if fewer than 6 valid receptor-hours
6 = Compute extinction from speciated PM measurements
- FLAG monthly RH adjustment factor applied to observed and
modeled sulfate and nitrate
7 = Use observed weather or prognostic weather information for
background extinction during weather events; otherwise, use Method 2
- Hourly F(RH) adjustment applied to modeled sulfate and nitrate
- F(RH) factor is capped at F(RHMAX)
- During observed weather events, compute Bext from visual range
if using an observed weather data file, or
- During prognostic weather events, use Bext from the prognostic
weather file
- Use Method 2 for hours without a weather event

Additional inputs used for MVISBK = 1:

Background light extinction (1/Mm)
(BEXTBK) -- No default ! BEXTBK = 12.0 !

Percentage of particles affected by relative humidity
(RHFRAC) -- No default   ! RHFRAC = 10.0 !

Additional inputs used for MVISBK = 6:

Extinction coefficients for hygroscopic species (modeled and background) are computed using a monthly RH adjustment factor in place of an hourly RH factor (VISB.DAT file is NOT needed). Enter the 12 monthly factors here (RHFAC). Month 1 is January.

(RHFAC) -- No default   ! RHFAC = 3.2, 2.9, 2.7, 2.7,
3.3, 3.3, 3.3, 3.3,
3.4, 3.1, 3.1, 3.3 !

Additional inputs used for MVISBK = 7:

The weather data file (DATSAV abbreviated space-delimited) that is identified as VSRN.DAT may contain data for more than one station. Identify the stations that are needed in the order in which they will be used to obtain valid weather and visual range. The first station that contains valid data for an hour will be used. Enter up to MXWSTA (set in PARAMS file) integer station IDs of up to 6 digits each as variable IDWSTA, and enter the corresponding time zone for each, as variable TZONE (= UTC-LST).

A prognostic weather data file with Bext for weather events may be used in place of the observed weather file. Identify this as the VSRN.DAT file and use a station ID of IDWSTA = 999999, and TZONE = 0.

NOTE: TZONE identifies the time zone used in the dataset. The DATSAV abbreviated space-delimited data usually are prepared with UTC time rather than local time, so TZONE is typically set to zero.

(IDWSTA) -- No default
! IDWSTA = 690230 ,80020 ,80140 !
(TZONE) -- No default
! TZONE = 0.0 ,0.0 ,0.0 !

Additional inputs used for MVISBK = 2,3,6,7:

Background extinction coefficients are computed from monthly CONCENTRATIONS of ammonium sulfate (BKSO4), ammonium nitrate (BKNO3), coarse particulates (BKPMC), organic carbon (BKOC), soil (BKSOIL), and elemental carbon (BKEC). Month 1 is January.

INPUT GROUP: 3 -- Output options
--------------

Documentation
-------------

 Documentation records contained in the header of the
 CALPUFF output file may be written to the list file.
 Print documentation image?
                  (LDOC) -- Default: F   !  LDOC = F !

Output Units
------------
 Units for All Output       (IPRTU) -- Default: 1   ! IPRTU =  3   !
              for            for
          Concentration    Deposition
   1 =        g/m**3        g/m**2/s
   2 =       mg/m**3        mg/m**2/s
   3 =       ug/m**3        ug/m**2/s
   4 =       ng/m**3        ng/m**2/s
   5 =     Odour Units

 Visibility: extinction expressed in 1/Mega-meters (IPRTU is ignored)

Averaging time(s) reported
--------------------------

 1-hr averages          (L1HR) -- Default: T   !   L1HR = F  !

 3-hr averages          (L3HR) -- Default: T   !   L3HR = F  !

 24-hr averages         (L24HR) -- Default: T   !  L24HR = F  !

 Run-length averages    (LRUNL) -- Default: T   !  LRUNL = F  !

 User-specified averaging time in hours - results for
 an averaging time of NAVG hours are reported for
```

NAVG greater than 0:
(NAVG) -- Default: 0 ! NAVG = 0 !

Types of tabulations reported
----

1) Visibility: daily visibility tabulations are always reported
for the selected receptors when ASPEC = VISIB.
In addition, any of the other tabulations listed
below may be chosen to characterize the light
extinction coefficients.
[List file or Plot/Analysis File]

2) Top 50 table for each averaging time selected
[List file only]
(LT50) -- Default: T ! LT50 = F !

3) Top 'N' table for each averaging time selected
[List file or Plot file]
(LTOPN) -- Default: F ! LTOPN = T !

-- Number of 'Top-N' values at each receptor
selected (NTOP must be <= 4)
(NTOP) -- Default: 4 ! NTOP = 1 !

-- Specific ranks of 'Top-N' values reported
(NTOP values must be entered)
(ITOP(4) array) -- Default: ! ITOP = 1 !
1,2,3,4

4) Threshold exceedance counts for each receptor and each averaging
time selected
[List file or Plot file]
(LEXCD) -- Default: F ! LEXCD = T !

-- Identify the threshold for each averaging time by assigning a
non-negative value (output units).

-- Default: 0.5
Threshold for 1-hr averages (THRESH1) ! THRESH1 = 1.000E01 !
Threshold for 3-hr averages (THRESH3) ! THRESH3 = -1.0 !
Threshold for 24-hr averages (THRESH24) ! THRESH24 = -1.0 !
Threshold for NAVG-hr averages (THRESHN) ! THRESHN = -1.0 !

-- Counts for the shortest averaging period selected can be
tallied daily, and receptors that experience more than NCOUNT
counts over any NDAY period will be reported. This type of
exceedance violation output is triggered only if NDAY > 0.

Accumulation period(Days)
(NDAY) -- Default: 0 ! NDAY = 0 !

Number of exceedances allowed
(NCOUNT) -- Default: 1 ! NCOUNT = 1 !

5) Selected day table(s)

Echo Option -- Many records are written each averaging period
selected and output is grouped by day
[List file or Plot file]
(LECHO) -- Default: F ! LECHO = F !

Timeseries Option -- Averages at all selected receptors for
each selected averaging period are written to timeseries files.
Each file contains one averaging period, and all receptors are
written to a single record each averaging time.
[TSERIES_ASPEC_ttHR_CONC_TSUNAM.DAT files]
(LTIME) -- Default: F ! LTIME = F !

Peak Value Option -- Averages at all selected receptors for
each selected averaging period are screened and the peak value
each period is written to timeseries files.
Each file contains one averaging period.
[PEAKVAL_ASPEC_ttHR_CONC_TSUNAM.DAT files]
(LPEAK) -- Default: F ! LPEAK = F !

-- Days selected for output
(IECHO(366)) -- Default: 366*0
! IECHO = 366*0 !
(366 values must be entered)

Plot output options

Plot files can be created for the Top-N, Exceedance, and Echo
tables selected above. Two formats for these files are available,
DATA and GRID. In the DATA format, results at all receptors are
listed along with the receptor location [x,y,val1,val2,...].
In the GRID format, results at only gridded receptors are written,
using a compact representation. The gridded values are written in
rows (x varies), starting with the most southern row of the grid.
The GRID format is given the .GRD extension, and includes headers
compatible with the SURFER(R) plotting software.

A plotting and analysis file can also be created for the daily
peak visibility summary output, in DATA format only.

Generate Plot file output in addition to writing tables
to List file?
(LPLT) -- Default: F ! LPLT = F !

Use GRID format rather than DATA format,
when available?
(LGRD) -- Default: F ! LGRD = F !

Auxiliary Output Files (for subsequent analyses)

Visibility

A separate output file may be requested that contains the change in visibility at each selected receptor when ASPEC = VISIB. This file can be processed to construct visibility measures that are not available in CALPOST.

Output file with the visibility change at each receptor?
(MDVIS) -- Default: 0 ! MDVIS = 0 !

0 = Do Not create file
1 = Create file of DAILY (24 hour) Delta-Deciview
2 = Create file of DAILY (24 hour) Extinction Change (%)
3 = Create file of HOURLY Delta-Deciview
4 = Create file of HOURLY Extinction Change (%)

Additional Debug Output

Output selected information to List file for debugging?
(LDEBUG) -- Default: F ! LDEBUG = F !

Output hourly extinction information to REPORT.HRV? (Visibility Method 7)
(LVEXTHR) -- Default: F ! LVEXTHR = F !

!END!

     (1 = every hour processed,
      2 = every 2nd hour processed,
      5 = every 5th hour processed, etc.)

Species & Concentration/Deposition Information
---------------------------------------------

     Species to process (ASPEC)       -- No default   ! ASPEC = VISIB  !
     (ASPEC = VISIB for visibility processing)

     Layer/deposition code (ILAYER)   -- Default: 1   ! ILAYER =  1  !
       '1'  for CALPUFF concentrations,
       '-1' for dry deposition fluxes,
       '-2' for wet deposition fluxes,
       '-3' for wet+dry deposition fluxes.

     Scaling factors of the form:     -- Defaults:    ! A =  0.0    !
          X(new) = X(old) * A + B         A = 0.0     ! B =  0.0    !
       (NOT applied if A = B = 0.0)       B = 0.0

     Add Hourly Background Concentrations/Fluxes?
                        (LBACK)  -- Default: F   ! LBACK =  F !

Source information
------------------

  Option to process source contributions:
       0 =  Process only total reported contributions
       1 =  Sum all individual source contributions and process
       2 =  Run in TRACEBACK mode to identify source
            contributions at a SINGLE receptor
                       (MSOURCE) -- Default: 0   ! MSOURCE =  0  !

Receptor information
--------------------

  Gridded receptors processed?    (LG) -- Default: F   ! LG  = F  !
  Discrete receptors processed?   (LD) -- Default: F   ! LD  = T  !
  CTSG Complex terrain receptors processed?
                           (LCT) -- Default: F   ! LCT = F  !

--Report results by DISCRETE receptor RING?
  (only used when LD = T)     (LDRING) -- Default: F   ! LDRING = F  !

--Select range of DISCRETE receptors (only used when LD = T):
```

```
  Select ALL DISCRETE receptors by setting NDRECP flag to -1;
                              OR
  Select SPECIFIC DISCRETE receptors by entering a flag (0,1) for each
     0 = discrete receptor not processed
     1 = discrete receptor processed
  using repeated value notation to select blocks of receptors:
     23*1, 15*0, 12*1
  Flag for all receptors after the last one assigned is set to 0
  (NDRECP) -- Default: -1
                                            ! NDRECP =  -1  !

--Select range of GRIDDED receptors (only used when LG = T):

       X index of LL corner (IBGRID) -- Default: -1     ! IBGRID = -1  !
           (-1 OR 1 <= IBGRID <= NX)

       Y index of LL corner (JBGRID) -- Default: -1     ! JBGRID = -1  !
           (-1 OR 1 <= JBGRID <= NY)

       X index of UR corner (IEGRID) -- Default: -1     ! IEGRID = -1  !
           (-1 OR 1 <= IEGRID <= NX)

       Y index of UR corner (JEGRID) -- Default: -1     ! JEGRID = -1  !
           (-1 OR 1 <= JEGRID <= NY)

  Note: Entire grid is processed if IBGRID=JBGRID=IEGRID=JEGRID=-1

--Specific gridded receptors can also be excluded from CALPOST
  processing by filling a processing grid array with 0s and 1s.  If the
  processing flag for receptor index (i,j) is 1 (ON), that receptor
  will be processed if it lies within the range delineated by IBGRID,
  JBGRID,IEGRID,JEGRID and if LG=T. If it is 0 (OFF), it will not be
  processed in the run.  By default, all array values are set to 1 (ON).

  Number of gridded receptor rows provided in Subgroup (1a) to
  identify specific gridded receptors to process
                        (NGONOFF) -- Default: 0      ! NGONOFF =  0  !

!END!

--------------
Subgroup (1a) -- Specific gridded receptors included/excluded
--------------

    Specific gridded receptors are excluded from CALPOST processing
    by filling a processing grid array with 0s and 1s.  A total of
    NGONOFF lines are read here.  Each line corresponds to one 'row'
    in the sampling grid, starting with the NORTHERNMOST row that
    contains receptors that you wish to exclude, and finishing with
    row 1 to the SOUTH (no intervening rows may be skipped).  Within
    a row, each receptor position is assigned either a 0 or 1,
    starting with the westernmost receptor.
       0 = gridded receptor not processed
```

```
      1 = gridded receptor processed

   Repeated value notation may be used to select blocks of receptors:
      23*1, 15*0, 12*1

   Because all values are initially set to 1, any receptors north of
   the first row entered, or east of the last value provided in a row,
   remain ON.

   (NGXRECP) -- Default: 1

Background Extinction Computation
---------------------------------

   Method used for the 24h-average of percent change of light extinction:
   Hourly ratio of source light extinction / background light extinction
   is averaged?             (LAVER) -- Default: F   ! LAVER = F  !

   Method used for background light extinction
                      (MVISBK) -- Default: 2   ! MVISBK =  2  !

       1 =  Supply single light extinction and hygroscopic fraction
          - Hourly F(RH) adjustment applied to hygroscopic background
            and modeled sulfate and nitrate
       2 =  Compute extinction from speciated PM measurements (A)
          - Hourly F(RH) adjustment applied to observed and modeled sulfate
            and nitrate
          - F(RH) factor is capped at F(RHMAX)
       3 =  Compute extinction from speciated PM measurements (B)
          - Hourly F(RH) adjustment applied to observed and modeled sulfate
            and nitrate
          - Receptor-hour excluded if RH>RHMAX
          - Receptor-day excluded if fewer than 6 valid receptor-hours
       4 =  Read hourly transmissometer background extinction measurements
          - Hourly F(RH) adjustment applied to modeled sulfate and nitrate
          - Hour excluded if measurement invalid (missing, interference,
            or large RH)
          - Receptor-hour excluded if RH>RHMAX
          - Receptor-day excluded if fewer than 6 valid receptor-hours
       5 =  Read hourly nephelometer background extinction measurements
          - Rayleigh extinction value (BEXTRAY) added to measurement
          - Hourly F(RH) adjustment applied to modeled sulfate and nitrate
          - Hour excluded if measurement invalid (missing, interference,
            or large RH)
          - Receptor-hour excluded if RH>RHMAX
          - Receptor-day excluded if fewer than 6 valid receptor-hours
       6 =  Compute extinction from speciated PM measurements
          - FLAG monthly RH adjustment factor applied to observed and
            modeled sulfate and nitrate
       7 =  Use observed weather or prognostic weather information for
          background extinction during weather events; otherwise, use Method 2
          - Hourly F(RH) adjustment applied to modeled sulfate and nitrate
          - F(RH) factor is capped at F(RHMAX)
          - During observed weather events, compute Bext from visual range
            if using an observed weather data file, or
          - During prognostic weather events, use Bext from the prognostic
            weather file
          - Use Method 2 for hours without a weather event

   Additional inputs used for MVISBK = 1:
   -------------------------------------
    Background light extinction (1/Mm)
                      (BEXTBK) -- No default   ! BEXTBK = 12.0 !
```

```
 Percentage of particles affected by relative humidity
                         (RHFRAC) -- No default   ! RHFRAC = 10.0 !

Additional inputs used for MVISBK = 6:
--------------------------------------
 Extinction coefficients for hygroscopic species (modeled and
 background) are computed using a monthly RH adjustment factor
 in place of an hourly RH factor (VISB.DAT file is NOT needed).
 Enter the 12 monthly factors here (RHFAC).  Month 1 is January.

 (RHFAC)  -- No default     ! RHFAC = 3.3, 3.0, 2.7, 2.8,
                                    3.4, 3.4, 3.4, 3.4,
                                    3.6, 3.3, 3.2, 3.3 !

Additional inputs used for MVISBK = 7:
--------------------------------------
 The weather data file (DATSAV abbreviated space-delimited) that
 is identified as VSRN.DAT may contain data for more than one
 station.  Identify the stations that are needed in the order in
 which they will be used to obtain valid weather and visual range.
 The first station that contains valid data for an hour will be
 used.  Enter up to MXWSTA (set in PARAMS file) integer station IDs
 of up to 6 digits each as variable IDWSTA, and enter the corresponding
 time zone for each, as variable TZONE (= UTC-LST).

 A prognostic weather data file with Bext for weather events may be used
 in place of the observed weather file.  Identify this as the VSRN.DAT
 file and use a station ID of IDWSTA = 999999, and TZONE = 0.

 NOTE:  TZONE identifies the time zone used in the dataset.  The
        DATSAV abbreviated space-delimited data usually are prepared
        with UTC time rather than local time, so TZONE is typically
        set to zero.

 (IDWSTA)   -- No default
! IDWSTA = 690230 ,80020 ,80140 !
 (TZONE)    -- No default
! TZONE  = 0.0 ,0.0 ,0.0 !

Additional inputs used for MVISBK = 2,3,6,7:
--------------------------------------------
 Background extinction coefficients are computed from monthly
 CONCENTRATIONS of ammonium sulfate (BKSO4), ammonium nitrate (BKNO3),
 coarse particulates (BKPMC), organic carbon (BKOC), soil (BKSOIL), and
 elemental carbon (BKEC).  Month 1 is January.
 (ug/m**3)

 (BKSO4)  -- No default     ! BKSO4 = 0.23, 0.23, 0.23, 0.23,
                                    0.23, 0.23, 0.23, 0.23,
                                    0.23, 0.23, 0.23, 0.23 !
 (BKNO3)  -- No default     ! BKNO3 = 0.1, 0.1, 0.1, 0.1,
                                    0.1, 0.1, 0.1, 0.1,

Documentation
-------------

   Documentation records contained in the header of the
   CALPUFF output file may be written to the list file.
   Print documentation image?
                      (LDOC) -- Default: F   !  LDOC = F !

Output Units
------------
   Units for All Output      (IPRTU) -- Default: 1   ! IPRTU =  3   !
                for           for
            Concentration    Deposition
     1 =       g/m**3         g/m**2/s
     2 =      mg/m**3         mg/m**2/s
     3 =      ug/m**3         ug/m**2/s
     4 =      ng/m**3         ng/m**2/s
     5 =     Odour Units

   Visibility: extinction expressed in 1/Mega-meters (IPRTU is ignored)

Averaging time(s) reported
--------------------------

   1-hr averages          (L1HR) -- Default: T   !   L1HR = F  !

   3-hr averages          (L3HR) -- Default: T   !   L3HR = F  !

   24-hr averages         (L24HR) -- Default: T   !  L24HR = F  !

   Run-length averages    (LRUNL) -- Default: T   !  LRUNL = F  !

   User-specified averaging time in hours - results for
   an averaging time of NAVG hours are reported for
```

NAVG greater than 0:
(NAVG) -- Default: 0 ! NAVG = 0 !

Types of tabulations reported
----

1) Visibility: daily visibility tabulations are always reported
for the selected receptors when ASPEC = VISIB.
In addition, any of the other tabulations listed
below may be chosen to characterize the light
extinction coefficients.
[List file or Plot/Analysis File]

2) Top 50 table for each averaging time selected
[List file only]
(LT50) -- Default: T ! LT50 = F !

3) Top 'N' table for each averaging time selected
[List file or Plot file]
(LTOPN) -- Default: F ! LTOPN = T !

-- Number of 'Top-N' values at each receptor
selected (NTOP must be <= 4)
(NTOP) -- Default: 4 ! NTOP = 1 !

-- Specific ranks of 'Top-N' values reported
(NTOP values must be entered)
(ITOP(4) array) -- Default: ! ITOP = 1 !
1,2,3,4

4) Threshold exceedance counts for each receptor and each averaging
time selected
[List file or Plot file]
(LEXCD) -- Default: F ! LEXCD = T !

-- Identify the threshold for each averaging time by assigning a
non-negative value (output units).

-- Default: 0.5
Threshold for 1-hr averages (THRESH1) ! THRESH1 = 1.000E01 !
Threshold for 3-hr averages (THRESH3) ! THRESH3 = -1.0 !
Threshold for 24-hr averages (THRESH24) ! THRESH24 = -1.0 !
Threshold for NAVG-hr averages (THRESHN) ! THRESHN = -1.0 !

-- Counts for the shortest averaging period selected can be
tallied daily, and receptors that experience more than NCOUNT
counts over any NDAY period will be reported. This type of
exceedance violation output is triggered only if NDAY > 0.

Accumulation period(Days)
(NDAY) -- Default: 0 ! NDAY = 0 !
Number of exceedances allowed

(NCOUNT) -- Default: 1   ! NCOUNT = 1 !

5) Selected day table(s)

Echo Option -- Many records are written each averaging period
selected and output is grouped by day
[List file or Plot file]
(LECHO) -- Default: F   ! LECHO = F !

Timeseries Option -- Averages at all selected receptors for
each selected averaging period are written to timeseries files.
Each file contains one averaging period, and all receptors are
written to a single record each averaging time.
[TSERIES_ASPEC_ttHR_CONC_TSUNAM.DAT files]
(LTIME) -- Default: F   ! LTIME = F !

Peak Value Option -- Averages at all selected receptors for
each selected averaging period are screened and the peak value
each period is written to timeseries files.
Each file contains one averaging period.
[PEAKVAL_ASPEC_ttHR_CONC_TSUNAM.DAT files]
(LPEAK) -- Default: F   ! LPEAK = F !

-- Days selected for output
(IECHO(366)) -- Default: 366*0
! IECHO = 366*0 !
(366 values must be entered)

Plot output options

Plot files can be created for the Top-N, Exceedance, and Echo
tables selected above. Two formats for these files are available,
DATA and GRID. In the DATA format, results at all receptors are
listed along with the receptor location [x,y,val1,val2,...].
In the GRID format, results at only gridded receptors are written,
using a compact representation. The gridded values are written in
rows (x varies), starting with the most southern row of the grid.
The GRID format is given the .GRD extension, and includes headers
compatible with the SURFER(R) plotting software.

A plotting and analysis file can also be created for the daily
peak visibility summary output, in DATA format only.

Generate Plot file output in addition to writing tables
to List file?
(LPLT) -- Default: F   ! LPLT = F !

Use GRID format rather than DATA format,
when available?
(LGRD) -- Default: F   ! LGRD = F !

Auxiliary Output Files (for subsequent analyses)

Visibility

A separate output file may be requested that contains the change in visibility at each selected receptor when ASPEC = VISIB. This file can be processed to construct visibility measures that are not available in CALPOST.

Output file with the visibility change at each receptor?
(MDVIS) -- Default: 0   ! MDVIS = 0 !

0 = Do Not create file
1 = Create file of DAILY (24 hour) Delta-Deciview
2 = Create file of DAILY (24 hour) Extinction Change (%)
3 = Create file of HOURLY Delta-Deciview
4 = Create file of HOURLY Extinction Change (%)

Additional Debug Output

Output selected information to List file
for debugging?
(LDEBUG) -- Default: F ! LDEBUG = F !

Output hourly extinction information to REPORT.HRV?
(Visibility Method 7)
(LVEXTHR) -- Default: F ! LVEXTHR = F !

!END!

       2 = every 2nd hour processed,
       5 = every 5th hour processed, etc.)

Species & Concentration/Deposition Information
----------------------------------------------

      Species to process (ASPEC)       -- No default   ! ASPEC = VISIB  !
      (ASPEC = VISIB for visibility processing)

      Layer/deposition code (ILAYER)   -- Default: 1   ! ILAYER =  1  !
        '1'  for CALPUFF concentrations,
        '-1' for dry deposition fluxes,
        '-2' for wet deposition fluxes,
        '-3' for wet+dry deposition fluxes.

      Scaling factors of the form:     -- Defaults:    ! A =  0.0    !
           X(new) = X(old) * A + B         A = 0.0    ! B =  0.0    !
        (NOT applied if A = B = 0.0)        B = 0.0

      Add Hourly Background Concentrations/Fluxes?
                        (LBACK)  -- Default: F   ! LBACK =  F !

Source information
------------------

  Option to process source contributions:
       0 =  Process only total reported contributions
       1 =  Sum all individual source contributions and process
       2 =  Run in TRACEBACK mode to identify source
            contributions at a SINGLE receptor
                        (MSOURCE) -- Default: 0   ! MSOURCE =  0  !

Receptor information
--------------------

  Gridded receptors processed?    (LG) -- Default: F   ! LG  = F  !
  Discrete receptors processed?   (LD) -- Default: F   ! LD  = T  !
  CTSG Complex terrain receptors processed?
                           (LCT) -- Default: F   ! LCT = F  !

--Report results by DISCRETE receptor RING?
  (only used when LD = T)     (LDRING) -- Default: F   ! LDRING = F  !

--Select range of DISCRETE receptors (only used when LD = T):
```

Select ALL DISCRETE receptors by setting NDRECP flag to -1;
OR
Select SPECIFIC DISCRETE receptors by entering a flag (0,1) for each
0 = discrete receptor not processed
1 = discrete receptor processed
using repeated value notation to select blocks of receptors:
23*1, 15*0, 12*1
Flag for all receptors after the last one assigned is set to 0
(NDRECP) -- Default: -1
! NDRECP = -1 !

--Select range of GRIDDED receptors (only used when LG = T):

X index of LL corner (IBGRID) -- Default: -1 ! IBGRID = -1 !
(-1 OR 1 <= IBGRID <= NX)

Y index of LL corner (JBGRID) -- Default: -1 ! JBGRID = -1 !
(-1 OR 1 <= JBGRID <= NY)

X index of UR corner (IEGRID) -- Default: -1 ! IEGRID = -1 !
(-1 OR 1 <= IEGRID <= NX)

Y index of UR corner (JEGRID) -- Default: -1 ! JEGRID = -1 !
(-1 OR 1 <= JEGRID <= NY)

Note: Entire grid is processed if IBGRID=JBGRID=IEGRID=JEGRID=-1

--Specific gridded receptors can also be excluded from CALPOST processing by filling a processing grid array with 0s and 1s. If the processing flag for receptor index (i,j) is 1 (ON), that receptor will be processed if it lies within the range delineated by IBGRID, JBGRID,IEGRID,JEGRID and if LG=T. If it is 0 (OFF), it will not be processed in the run. By default, all array values are set to 1 (ON).

Number of gridded receptor rows provided in Subgroup (1a) to identify specific gridded receptors to process
(NGONOFF) -- Default: 0 ! NGONOFF = 0 !

!END!

Subgroup (1a) -- Specific gridded receptors included/excluded
----

Specific gridded receptors are excluded from CALPOST processing by filling a processing grid array with 0s and 1s. A total of NGONOFF lines are read here. Each line corresponds to one 'row' in the sampling grid, starting with the NORTHERNMOST row that contains receptors that you wish to exclude, and finishing with row 1 to the SOUTH (no intervening rows may be skipped). Within a row, each receptor position is assigned either a 0 or 1, starting with the westernmost receptor.
0 = gridded receptor not processed

```
     1 = gridded receptor processed

   Repeated value notation may be used to select blocks of receptors:
     23*1, 15*0, 12*1

   Because all values are initially set to 1, any receptors north of
   the first row entered, or east of the last value provided in a row,
   remain ON.

   (NGXRECP) -- Default: 1

ELEMENTAL CARBON (EEEC) -- Default: 10. ! EEEC = 10.0 !

Background Extinction Computation

Method used for the 24h-average of percent change of light extinction:
Hourly ratio of source light extinction / background light extinction
is averaged? (LAVER) -- Default: F ! LAVER = F !

Method used for background light extinction
(MVISBK) -- Default: 2 ! MVISBK = 6 !

1 = Supply single light extinction and hygroscopic fraction
- Hourly F(RH) adjustment applied to hygroscopic background and modeled sulfate and nitrate

2 = Compute extinction from speciated PM measurements (A)
- Hourly F(RH) adjustment applied to observed and modeled sulfate and nitrate
- F(RH) factor is capped at F(RHMAX)

3 = Compute extinction from speciated PM measurements (B)
- Hourly F(RH) adjustment applied to observed and modeled sulfate and nitrate
- Receptor-hour excluded if RH>RHMAX
- Receptor-day excluded if fewer than 6 valid receptor-hours

4 = Read hourly transmissometer background extinction measurements
- Hourly F(RH) adjustment applied to modeled sulfate and nitrate
- Hour excluded if measurement invalid (missing, interference, or large RH)
- Receptor-hour excluded if RH>RHMAX
- Receptor-day excluded if fewer than 6 valid receptor-hours

5 = Read hourly nephelometer background extinction measurements
- Rayleigh extinction value (BEXTRAY) added to measurement
- Hourly F(RH) adjustment applied to modeled sulfate and nitrate
- Hour excluded if measurement invalid (missing, interference, or large RH)
- Receptor-hour excluded if RH>RHMAX
- Receptor-day excluded if fewer than 6 valid receptor-hours

6 = Compute extinction from speciated PM measurements
- FLAG monthly RH adjustment factor applied to observed and modeled sulfate and nitrate

7 = Use observed weather or prognostic weather information for background extinction during weather events; otherwise, use Method 2
- Hourly F(RH) adjustment applied to modeled sulfate and nitrate
- F(RH) factor is capped at F(RHMAX)
- During observed weather events, compute Bext from visual range if using an observed weather data file, or
- During prognostic weather events, use Bext from the prognostic weather file
- Use Method 2 for hours without a weather event

Additional inputs used for MVISBK = 1:

Background light extinction (1/Mm)
(BEXTBK) -- No default ! BEXTBK = 12.0 !

Percentage of particles affected by relative humidity
(RHFRAC) -- No default ! RHFRAC = 10.0 !

Additional inputs used for MVISBK = 6:

Extinction coefficients for hygroscopic species (modeled and background) are computed using a monthly RH adjustment factor in place of an hourly RH factor (VISB.DAT file is NOT needed). Enter the 12 monthly factors here (RHFAC). Month 1 is January.

```
(RHFAC)  -- No default     ! RHFAC = 3.3, 3.0, 2.7, 2.8,
                             3.4, 3.4, 3.4, 3.4,
                             3.6, 3.3, 3.2, 3.3 !
```

Additional inputs used for MVISBK = 7:

The weather data file (DATSAV abbreviated space-delimited) that is identified as VSRN.DAT may contain data for more than one station. Identify the stations that are needed in the order in which they will be used to obtain valid weather and visual range. The first station that contains valid data for an hour will be used. Enter up to MXWSTA (set in PARAMS file) integer station IDs of up to 6 digits each as variable IDWSTA, and enter the corresponding time zone for each, as variable TZONE (= UTC-LST).

A prognostic weather data file with Bext for weather events may be used in place of the observed weather file. Identify this as the VSRN.DAT file and use a station ID of IDWSTA = 999999, and TZONE = 0.

NOTE: TZONE identifies the time zone used in the dataset. The DATSAV abbreviated space-delimited data usually are prepared with UTC time rather than local time, so TZONE is typically set to zero.

```
 (IDWSTA)   -- No default
! IDWSTA = 690230 ,80020 ,80140 !
 (TZONE)    -- No default
! TZONE  = 0.0 ,0.0 ,0.0 !
```

Additional inputs used for MVISBK = 2,3,6,7:

Background extinction coefficients are computed from monthly CONCENTRATIONS of ammonium sulfate (BKSO4), ammonium nitrate (BKNO3), coarse particulates (BKPMC), organic carbon (BKOC), soil (BKSOIL), and elemental carbon (BKEC). Month 1 is January.
(ug/m**3)

    User-specified averaging time in hours - results for
    an averaging time of NAVG hours are reported for
```

NAVG greater than 0:
(NAVG) -- Default: 0 ! NAVG = 0 !

Types of tabulations reported
----

1) Visibility: daily visibility tabulations are always reported
for the selected receptors when ASPEC = VISIB.
In addition, any of the other tabulations listed
below may be chosen to characterize the light
extinction coefficients.
[List file or Plot/Analysis File]

2) Top 50 table for each averaging time selected
[List file only]
(LT50) -- Default: T ! LT50 = F !

3) Top 'N' table for each averaging time selected
[List file or Plot file]
(LTOPN) -- Default: F ! LTOPN = T !

-- Number of 'Top-N' values at each receptor
selected (NTOP must be <= 4)
(NTOP) -- Default: 4 ! NTOP = 1 !

-- Specific ranks of 'Top-N' values reported
(NTOP values must be entered)
(ITOP(4) array) -- Default: ! ITOP = 1 !
1,2,3,4

4) Threshold exceedance counts for each receptor and each averaging
time selected
[List file or Plot file]
(LEXCD) -- Default: F ! LEXCD = T !

-- Identify the threshold for each averaging time by assigning a
non-negative value (output units).

-- Default: 0.5
Threshold for 1-hr averages (THRESH1) ! THRESH1 = 1.000E01 !
Threshold for 3-hr averages (THRESH3) ! THRESH3 = -1.0 !
Threshold for 24-hr averages (THRESH24) ! THRESH24 = -1.0 !
Threshold for NAVG-hr averages (THRESHN) ! THRESHN = -1.0 !

-- Counts for the shortest averaging period selected can be
tallied daily, and receptors that experience more than NCOUNT
counts over any NDAY period will be reported. This type of
exceedance violation output is triggered only if NDAY > 0.

Accumulation period(Days)
(NDAY) -- Default: 0 ! NDAY = 0 !
Number of exceedances allowed

(NCOUNT) -- Default: 1 ! NCOUNT = 1 !

5) Selected day table(s)

Echo Option -- Many records are written each averaging period
selected and output is grouped by day
[List file or Plot file]
(LECHO) -- Default: F ! LECHO = F !

Timeseries Option -- Averages at all selected receptors for
each selected averaging period are written to timeseries files.
Each file contains one averaging period, and all receptors are
written to a single record each averaging time.
[TSERIES_ASPEC_ttHR_CONC_TSUNAM.DAT files]
(LTIME) -- Default: F ! LTIME = F !

Peak Value Option -- Averages at all selected receptors for
each selected averaging period are screened and the peak value
each period is written to timeseries files.
Each file contains one averaging period.
[PEAKVAL_ASPEC_ttHR_CONC_TSUNAM.DAT files]
(LPEAK) -- Default: F ! LPEAK = F !

-- Days selected for output
(IECHO(366)) -- Default: 366*0
! IECHO = 366*0 !
(366 values must be entered)

Plot output options

Plot files can be created for the Top-N, Exceedance, and Echo
tables selected above. Two formats for these files are available,
DATA and GRID. In the DATA format, results at all receptors are
listed along with the receptor location [x,y,val1,val2,...].
In the GRID format, results at only gridded receptors are written,
using a compact representation. The gridded values are written in
rows (x varies), starting with the most southern row of the grid.
The GRID format is given the .GRD extension, and includes headers
compatible with the SURFER(R) plotting software.

A plotting and analysis file can also be created for the daily
peak visibility summary output, in DATA format only.

Generate Plot file output in addition to writing tables
to List file?
(LPLT) -- Default: F ! LPLT = F !

Use GRID format rather than DATA format,
when available?
(LGRD) -- Default: F ! LGRD = F !

Auxiliary Output Files (for subsequent analyses)

Visibility

A separate output file may be requested that contains the change
in visibility at each selected receptor when ASPEC = VISIB. This
file can be processed to construct visibility measures that are
not available in CALPOST.

Output file with the visibility change at each receptor?
(MDVIS) -- Default: 0   ! MDVIS = 0 !

0 = Do Not create file
1 = Create file of DAILY (24 hour) Delta-Deciview
2 = Create file of DAILY (24 hour) Extinction Change (%)
3 = Create file of HOURLY Delta-Deciview
4 = Create file of HOURLY Extinction Change (%)

Additional Debug Output

Output selected information to List file
for debugging?
(LDEBUG) -- Default: F ! LDEBUG = F !

Output hourly extinction information to REPORT.HRV?
(Visibility Method 7)
(LVEXTHR) -- Default: F ! LVEXTHR = F !

!END!

                         (LBACK)  -- Default: F   ! LBACK =  F !

Source information
------------------

  Option to process source contributions:
       0 =  Process only total reported contributions
       1 =  Sum all individual source contributions and process
       2 =  Run in TRACEBACK mode to identify source
            contributions at a SINGLE receptor
                      (MSOURCE) -- Default: 0   ! MSOURCE =  0  !

Receptor information
--------------------

  Gridded receptors processed?    (LG) -- Default: F   ! LG  = F  !
  Discrete receptors processed?   (LD) -- Default: F   ! LD  = T  !
  CTSG Complex terrain receptors processed?
                           (LCT) -- Default: F   ! LCT = F  !

--Report results by DISCRETE receptor RING?
  (only used when LD = T)     (LDRING) -- Default: F   ! LDRING = F  !

--Select range of DISCRETE receptors (only used when LD = T):
```

Select ALL DISCRETE receptors by setting NDRECP flag to -1;
OR
Select SPECIFIC DISCRETE receptors by entering a flag (0,1) for each
0 = discrete receptor not processed
1 = discrete receptor processed
using repeated value notation to select blocks of receptors:
23*1, 15*0, 12*1
Flag for all receptors after the last one assigned is set to 0
(NDRECP) -- Default: -1
! NDRECP = -1 !

--Select range of GRIDDED receptors (only used when LG = T):

X index of LL corner (IBGRID) -- Default: -1   ! IBGRID = -1 !
(-1 OR 1 <= IBGRID <= NX)

Y index of LL corner (JBGRID) -- Default: -1   ! JBGRID = -1 !
(-1 OR 1 <= JBGRID <= NY)

X index of UR corner (IEGRID) -- Default: -1   ! IEGRID = -1 !
(-1 OR 1 <= IEGRID <= NX)

Y index of UR corner (JEGRID) -- Default: -1   ! JEGRID = -1 !
(-1 OR 1 <= JEGRID <= NY)

Note: Entire grid is processed if IBGRID=JBGRID=IEGRID=JEGRID=-1

--Specific gridded receptors can also be excluded from CALPOST processing by filling a processing grid array with 0s and 1s. If the processing flag for receptor index (i,j) is 1 (ON), that receptor will be processed if it lies within the range delineated by IBGRID, JBGRID,IEGRID,JEGRID and if LG=T. If it is 0 (OFF), it will not be processed in the run. By default, all array values are set to 1 (ON).

Number of gridded receptor rows provided in Subgroup (1a) to identify specific gridded receptors to process
(NGONOFF) -- Default: 0   ! NGONOFF = 0 !

!END!

Subgroup (1a) -- Specific gridded receptors included/excluded
----

Specific gridded receptors are excluded from CALPOST processing by filling a processing grid array with 0s and 1s. A total of NGONOFF lines are read here. Each line corresponds to one 'row' in the sampling grid, starting with the NORTHERNMOST row that contains receptors that you wish to exclude, and finishing with row 1 to the SOUTH (no intervening rows may be skipped). Within a row, each receptor position is assigned either a 0 or 1, starting with the westernmost receptor.
0 = gridded receptor not processed

```
       1 = gridded receptor processed

    Repeated value notation may be used to select blocks of receptors:
       23*1, 15*0, 12*1

    Because all values are initially set to 1, any receptors north of
    the first row entered, or east of the last value provided in a row,
    remain ON.

    (NGXRECP) -- Default: 1

 modeled sulfate and nitrate
7 = Use observed weather or prognostic weather information for
 background extinction during weather events; otherwise, use Method 2
 - Hourly F(RH) adjustment applied to modeled sulfate and nitrate
 - F(RH) factor is capped at F(RHMAX)
 - During observed weather events, compute Bext from visual range
 if using an observed weather data file, or
 - During prognostic weather events, use Bext from the prognostic
 weather file
 - Use Method 2 for hours without a weather event

Additional inputs used for MVISBK = 1:

Background light extinction (1/Mm)
(BEXTBK) -- No default ! BEXTBK = 12.0 !

Percentage of particles affected by relative humidity
(RHFRAC) -- No default ! RHFRAC = 10.0 !

Additional inputs used for MVISBK = 6:

Extinction coefficients for hygroscopic species (modeled and background) are computed using a monthly RH adjustment factor in place of an hourly RH factor (VISB.DAT file is NOT needed). Enter the 12 monthly factors here (RHFAC). Month 1 is January.

```
(RHFAC)  -- No default     ! RHFAC = 3.4, 3.1, 2.9, 2.6,
                             3.2, 3.5, 3.7, 3.9,
                             3.9, 3.4, 3.2, 3.5 !
```

Additional inputs used for MVISBK = 7:

The weather data file (DATSAV abbreviated space-delimited) that is identified as VSRN.DAT may contain data for more than one station. Identify the stations that are needed in the order in which they will be used to obtain valid weather and visual range. The first station that contains valid data for an hour will be used. Enter up to MXWSTA (set in PARAMS file) integer station IDs of up to 6 digits each as variable IDWSTA, and enter the corresponding time zone for each, as variable TZONE (= UTC-LST).

A prognostic weather data file with Bext for weather events may be used in place of the observed weather file. Identify this as the VSRN.DAT file and use a station ID of IDWSTA = 999999, and TZONE = 0.

NOTE: TZONE identifies the time zone used in the dataset. The DATSAV abbreviated space-delimited data usually are prepared with UTC time rather than local time, so TZONE is typically set to zero.

```
 (IDWSTA)   -- No default
! IDWSTA = 690230 ,80020 ,80140 !
 (TZONE)    -- No default
! TZONE  = 0.0 ,0.0 ,0.0 !
```

Additional inputs used for MVISBK = 2,3,6,7:

Background extinction coefficients are computed from monthly CONCENTRATIONS of ammonium sulfate (BKSO4), ammonium nitrate (BKNO3), coarse particulates (BKPMC), organic carbon (BKOC), soil (BKSOIL), and elemental carbon (BKEC). Month 1 is January.
(ug/m**3)

```
(BKSO4)  -- No default     ! BKSO4 = 0.23, 0.23, 0.23, 0.23,
                             0.23, 0.23, 0.23, 0.23,
                             0.23, 0.23, 0.23, 0.23 !
(BKNO3)  -- No default     ! BKNO3 = 0.1, 0.1, 0.1, 0.1,
                             0.1, 0.1, 0.1, 0.1,
                             0.1, 0.1, 0.1, 0.1 !
(BKPMC)  -- No default     ! BKPMC = 3.0, 3.0, 3.0, 3.0,
                             3.0, 3.0, 3.0, 3.0,
                             3.0, 3.0, 3.0, 3.0 !
```

```
 (BKOC)   -- No default     ! BKOC  = 1.4, 1.4, 1.4, 1.4,
                                1.4, 1.4, 1.4, 1.4,
                                1.4, 1.4, 1.4, 1.4 !
 (BKSOIL) -- No default     ! BKSOIL= 0.5, 0.5, 0.5, 0.5,
                                0.5, 0.5, 0.5, 0.5,
                                0.5, 0.5, 0.5, 0.5 !
 (BKEC)   -- No default     ! BKEC  = 0.02, 0.02, 0.02, 0.02,
                                0.02, 0.02, 0.02, 0.02,
                                0.02, 0.02, 0.02, 0.02 !

Additional inputs used for MVISBK = 2,3,5,6,7:
-----------------------------------------------
 Extinction due to Rayleigh scattering is added (1/Mm)
                (BEXTRAY) -- Default: 10.0 ! BEXTRAY = 10.0 !

!END!
-------------------------------------------------------------------------------

INPUT GROUP: 3 -- Output options

Documentation
-------------

   Documentation records contained in the header of the
   CALPUFF output file may be written to the list file.
   Print documentation image?
                  (LDOC) -- Default: F   !  LDOC = F !

Output Units
------------
   Units for All Output       (IPRTU) -- Default: 1   ! IPRTU =  3   !
                for           for
           Concentration    Deposition
     1 =        g/m**3        g/m**2/s
     2 =       mg/m**3        mg/m**2/s
     3 =       ug/m**3       ug/m**2/s
     4 =       ng/m**3       ng/m**2/s
     5 =     Odour Units

   Visibility: extinction expressed in 1/Mega-meters (IPRTU is ignored)

Averaging time(s) reported
--------------------------

   1-hr averages          (L1HR) -- Default: T   !   L1HR = F  !

   3-hr averages          (L3HR) -- Default: T   !   L3HR = F  !

   24-hr averages         (L24HR) -- Default: T   !  L24HR = F  !

   Run-length averages    (LRUNL) -- Default: T   !  LRUNL = F  !

   User-specified averaging time in hours - results for
   an averaging time of NAVG hours are reported for
```

NAVG greater than 0:
(NAVG) -- Default: 0 ! NAVG = 0 !

Types of tabulations reported
----

1) Visibility: daily visibility tabulations are always reported
for the selected receptors when ASPEC = VISIB.
In addition, any of the other tabulations listed
below may be chosen to characterize the light
extinction coefficients.
[List file or Plot/Analysis File]

2) Top 50 table for each averaging time selected
[List file only]
(LT50) -- Default: T ! LT50 = F !

3) Top 'N' table for each averaging time selected
[List file or Plot file]
(LTOPN) -- Default: F ! LTOPN = T !

-- Number of 'Top-N' values at each receptor
selected (NTOP must be <= 4)
(NTOP) -- Default: 4 ! NTOP = 1 !

-- Specific ranks of 'Top-N' values reported
(NTOP values must be entered)
(ITOP(4) array) -- Default: ! ITOP = 1 !
1,2,3,4

4) Threshold exceedance counts for each receptor and each averaging
time selected
[List file or Plot file]
(LEXCD) -- Default: F ! LEXCD = T !

-- Identify the threshold for each averaging time by assigning a
non-negative value (output units).

-- Default: 0.5
Threshold for 1-hr averages (THRESH1) ! THRESH1 = 1.000E01 !
Threshold for 3-hr averages (THRESH3) ! THRESH3 = -1.0 !
Threshold for 24-hr averages (THRESH24) ! THRESH24 = -1.0 !
Threshold for NAVG-hr averages (THRESHN) ! THRESHN = -1.0 !

-- Counts for the shortest averaging period selected can be
tallied daily, and receptors that experience more than NCOUNT
counts over any NDAY period will be reported. This type of
exceedance violation output is triggered only if NDAY > 0.

Accumulation period(Days)
(NDAY) -- Default: 0 ! NDAY = 0 !
Number of exceedances allowed

(NCOUNT) -- Default: 1 ! NCOUNT = 1 !

5) Selected day table(s)

Echo Option -- Many records are written each averaging period
selected and output is grouped by day
[List file or Plot file]
(LECHO) -- Default: F ! LECHO = F !

Timeseries Option -- Averages at all selected receptors for
each selected averaging period are written to timeseries files.
Each file contains one averaging period, and all receptors are
written to a single record each averaging time.
[TSERIES_ASPEC_ttHR_CONC_TSUNAM.DAT files]
(LTIME) -- Default: F ! LTIME = F !

Peak Value Option -- Averages at all selected receptors for
each selected averaging period are screened and the peak value
each period is written to timeseries files.
Each file contains one averaging period.
[PEAKVAL_ASPEC_ttHR_CONC_TSUNAM.DAT files]
(LPEAK) -- Default: F ! LPEAK = F !

-- Days selected for output
(IECHO(366)) -- Default: 366*0
! IECHO = 366*0 !
(366 values must be entered)

Plot output options

Plot files can be created for the Top-N, Exceedance, and Echo
tables selected above. Two formats for these files are available,
DATA and GRID. In the DATA format, results at all receptors are
listed along with the receptor location [x,y,val1,val2,...].
In the GRID format, results at only gridded receptors are written,
using a compact representation. The gridded values are written in
rows (x varies), starting with the most southern row of the grid.
The GRID format is given the .GRD extension, and includes headers
compatible with the SURFER(R) plotting software.

A plotting and analysis file can also be created for the daily
peak visibility summary output, in DATA format only.

Generate Plot file output in addition to writing tables
to List file?
(LPLT) -- Default: F ! LPLT = F !

Use GRID format rather than DATA format,
when available?
(LGRD) -- Default: F ! LGRD = F !

Auxiliary Output Files (for subsequent analyses)

Visibility

A separate output file may be requested that contains the change in visibility at each selected receptor when ASPEC = VISIB. This file can be processed to construct visibility measures that are not available in CALPOST.

Output file with the visibility change at each receptor?
(MDVIS) -- Default: 0 ! MDVIS = 0 !

0 = Do Not create file
1 = Create file of DAILY (24 hour) Delta-Deciview
2 = Create file of DAILY (24 hour) Extinction Change (%)
3 = Create file of HOURLY Delta-Deciview
4 = Create file of HOURLY Extinction Change (%)

Additional Debug Output

Output selected information to List file
for debugging?
(LDEBUG) -- Default: F ! LDEBUG = F !

Output hourly extinction information to REPORT.HRV?
(Visibility Method 7)
(LVEXTHR) -- Default: F ! LVEXTHR = F !

!END!
